Safety Precautions

Observe the following notices to ensure personal safety or to prevent accidents.
To ensure that you use this product correctly, read this User's Manual thoroughly before use.
Make sure that you fully understand the product and information on safety.
This manual uses two safety flags to indicate different levels of danger.

WARNING

If critical situations that could lead to user's death or serious injury is assumed by mishandling of the product.

- Always take precautions to ensure the overall safety of your system, so that the whole system remains safe in the event of failure of this product or other external factor.
- Do not use this product in areas with inflammable gas. It could lead to an explosion.
- Exposing this product to excessive heat or open flames could cause damage to the lithium battery or other electronic parts.

CAUTION

If critical situations that could lead to user's injury or only property damage is assumed by mishandling of the product.

- To prevent excessive exothermic heat or smoke generation, use this product at the values less than the maximum of the characteristics and performance that are assured in these specifications.
- Do not dismantle or remodel the product. It could cause excessive exothermic heat or smoke generation.
- Do not touch the terminal while turning on electricity. It could lead to an electric shock.
- Use the external devices to function the emergency stop and interlock circuit.
- Connect the wires or connectors securely.
The loose connection could cause excessive exothermic heat or smoke generation.
- Do not allow foreign matters such as liquid, inflammable materials, metals to go into the inside of the product. It could cause excessive exothermic heat or smoke generation.
- Do not undertake construction (such as connection and disconnection) while the power supply is on. It could lead to an electric shock.

Introduction

Thank you for buying a Panasonic product. Before you use the product, please carefully read the installation instructions and the users manual, and understand their contents in detail to use the product properly.

Types of Manual

- There are different types of users manual for the FP7 series, as listed below. Please refer to a relevant manual for the unit and purpose of your use.
- The manuals can be downloaded on our website:
http://industrial.panasonic.com/ac/e/dl_center/manual/

1

Functions of Unit and Restrictions on Combinations

1.1 Functions of Positioning Unit

1.1.1 Functions of Unit

- The positioning unit can perform positioning control when it is used in combination with a stepping motor or servomotor equipped with a driver of pulse string input type.

Positioning control with stepping motor

Positioning control with servomotor

■ Transistor output (open collector) type and line driver output type available

Two types are available—a line driver output type for high-speed control and a transistor output type for a motor equipped with a driver that connects only to open collector output (e.g., a stepping motor). If either type is applicable to your application, the use of the unit with line driver output is recommended.

■ Setting in configuration menu

The dedicated software Configurator PM7 is available, which allows ease of creating a variety of parameters and positioning tables required for positioning control.

Note) The Configurator PM7 will start by pressing [Advanced] button in the "I/O map" dialog box of the configuration menu of the FPWIN GR7.

■ Interpolation control

The 2-axis linear interpolation, 2-axis circular interpolation, 3-axis linear interpolation, and 3-axis spiral interpolation control can be performed.

■ Synchronous control

The unit supports synchronous control using an electronic gear, electronic clutch, and electronic cam. The unit can perform synchronous control with an actual or virtual axis as a master axis.

1.1.2 Unit Type

■ Product type

Type	Product no.
2-axis transistor	AFP7PP02T
2-axis line driver	AFP7PP02L
4-axis transistor	AFP7PP04T
4-axis line driver	AFP7PP04L

1.2 Restrictions on Combinations of Units

When the system is configured, take the other units being used into consideration and use a power supply unit with a sufficient capacity.

■ Current consumption

Type	Product no.	Current consumption
2-axis transistor	AFP7PP02T	120 mA
2-axis line driver	AFP7PP02L	120 mA
4-axis transistor	AFP7PP04T	120 mA
4-axis line driver	AFP7PP04L	120 mA

2

Names and Functions of Parts

2.1 Names and Functions of Parts

① Operation monitor LEDs

Displays the operating status of two axes.

② Operating monitor switch (AFP7PP04T and AFP7PP04L only)

Toggles between the operating status display of 1st and 2nd axes and that of the 3rd and 4th axes.

③ User I/F connector (1st axis and 2nd axis)

A connector for a motor driver and external interface.

④ User I/F connector (3rd axis and 4th axis) (AFP7PP04T and AFP7PP04L only)

A connector for a motor driver and external interface.

2.2 Operating Status LEDs

The LEDs display the operating status of two axes at a time. If the unit is of 4-axis type, use the switch to toggle between the operating status display of the 1st and 2nd axes and that of the 3rd and 4-axes. The contents of the LED display are the same in each axis.

Operation monitor LEDs

LED	Description		Color	ON	OFF	Flashing
A	Pulse output A-signal display (note 1)	With pulse/sign output settings	Green	– (note 4)	Not in operation	Pulse output
		With CW/CCW output settings	Green	– (note 4)	Not in operation (forward rotation)	In pulse output operation (forward rotation)
B	Pulse output B-signal display (note 1)	With pulse/sign output settings	Green	Reverse rotation instruction	Forward rotation instruction	–
		With CW/CCW output settings	Green	–	Not in operation (reverse rotation)	In pulse output operation (reverse rotation)
CL	Displays counter clear signal output		Green	Output ON	Output OFF	–
D	Displays near home state (note 2)		Green	ON	OFF	–
Z	Displays home input state (note 2)		Green	ON	OFF	–
PA	Pulse input A-signal display (note 3)		Green	Displays the input status of pulse input A-signal		
PB	Pulse input B-signal display (note 3)		Green	Displays the input status of pulse input B-signal		
ERR	Displays the occurrence of error or warning		Red	If an error occurs	Normal operation	If a warning occurs
ALARM	Displays hardware error		Red	If a hardware error occurs	Normal operation	–

(Note 1): The LED for the pulse output A-signal flashes at a cycle (speed) of output frequency, thus looking as if it were continuously lit if the speed is high. So is the LED for the pulse output B-signal.

(Note 2): Near home input (D) and home input (Z) will be lit if the respective inputs are enabled.

(Note 3) The input status of pulse input signals (PA) and (PB) will be displayed.

(Note 4) The LEDs may be continuously lit with or without pulse output if the electronic clutch or electronic cam is in operation.

Names and Functions of Parts

3

Wiring

3.1 Connection over Wire-pressed Terminal Cable

3.1.1 Specifications of Wire-pressed Terminal Cable

This is a connector that allows loose wires to be connected without removing the wires' insulation. The pressure connection tool is required to connect the loose wires.

Discrete-wire connector (40P)

Suitable wires (strand wire)

Size	Nominal cross-sectional area	Insulation thickness	Rated current
AWG#22	0.3 mm ²	1.5 to 1.1 dia.	3 A
AWG#24	0.2 mm ²		

Connector for wire-pressed terminal cable (provided with the unit)

Manufacturer	Composition of parts	Unit type and required quantity	
		2-axis type	4-axis type
Panasonic made	Housing (40P)	1 x 1 set	1 x 2 sets
	Semi-cover (40P)	2 x 1 set	2 x 2 sets
	5-pin contact (for AW22 and AW24)	8 x 1 set	8 x 2 sets

(Note) One set is provided for the 2-axis type and two sets are provided for the 4-axis type. If you need more connectors, purchase AFP2801 (2 sets/pack).

Pressure connection tool

Manufacturer	Product no.
Panasonic made	AXY52000FP

Pressure connection tool

3.1.2 Assembly of Connector for Wire-pressed Terminal Cable

The wire end can be directly crimped without removing the wire's insulation, which saves wiring effort.

(Procedure)

1. Bend the contact back from the carrier, and set it in the pressure connection tool.

2. Insert the wire without removing its insulation until it stops, and lightly grip the tool.

3. After press fitting the wire, insert it into the housing.

4. When all wires have been inserted, fit the semi-cover into place.

◆ KEY POINTS

- **Contact puller pin to redo wiring**
If there is a wiring mistake or the wire is incorrectly pressure-connected, use the contact puller pin provided with the fitting to remove the contact.

3.2 I/O Specifications and Terminal Wiring

3.2.1 I/O Specifications

The 4-axis type and 2-axis type use two connectors and one connector, respectively. Signal pins for two axes are allocated to a single connector. There is no difference in pin arrangement between the AX1 and AX2 connector and the AX3 and AX4 connector if the unit is of the 4-axis type. Any pins with the same number have the same function. The transistor type and line driver type are the same in input terminal and power terminal specifications. Only the performance of the pulse output terminal of the transistor type and that of the line driver type are different from each other.

Output terminal (transistor output type)

Pin no.		Circuit	Signal name	Items	Description
1st/ 3rd axis	2nd/ 4th axis				
A1	A10		Pulse output A: 5 V DC output	Output specifications	Output type Open collector
B1	B10		Pulse output A: Open collector		Operating voltage range 4.75 to 26.4 V DC
A2	A11		Pulse output B: 5 V DC output		Max. load current 15 mA
B2	B11		Pulse output B: Open collector		ON-state voltage drop 0.6 V

Output terminal (line driver output type)

Pin no.		Circuit	Signal name	Items	Description
1st/ 3rd axis	2nd/ 4th axis				
A1	A10		Pulse output A: Line driver (+)	Output specifications	Line driver output AM26C31 or equivalent
B1	B10		Pulse output A: Line driver (-)		
A2	A11		Pulse output B: Line driver (-)		
B2	B11		Pulse output B: Line driver (-)		

Output terminal (common)

Pin no.		Circuit	Signal name	Items	Description
1st/ 3rd axis	2nd/ 4th axis				
A7	A16		Deviation counter clear	Output specifications	Output type Open collector
B7	B16		COM		Operating voltage range 4.75 to 26.4 V DC
B5	B14		Servo ON		Max. load current 10 mA
					ON-state voltage drop 1.0 V

(Note): The deviation counter clear signal will be output for 1 ms on completion of home return control.

Power supply terminal (common)

Pin no.	Circuit	Signal name	Items	Description
A20		External power supply input: 24 V DC (+)	Power supply specifications	Supply power range 21.4 to 26.4 V DC
B20		External power supply input: 24 V DC (-)		Current consumption 4-axis type 90 mA max. 2-axis type 50 mA max.

(Note): In the case of the 4-axis type, the external power supply input terminals of the two connectors are connected internally.

Input terminal (common)

Pin no.		Circuit	Signal name	Items	Description
1st/ 3rd axis	2nd/ 4th axis				
A3	A12		Home input 24 V DC (+) (Z24)	Input specifications	Operating voltage range 21.6 to 26.4 V DC
					Minimum ON voltage/current 19.2 V DC/5.5 mA
					Maximum OFF voltage/current 2 V DC/2 mA
					Input impedance Approximately 3 kΩ
					Minimum input pulse width 100 µs or over
A4	A13		Home input 5 V DC (+) (Z5)	Input specifications	Operating voltage range 3.5 to 5.25 V DC (5 V DC, line driver specifications)
					Minimum ON voltage/current 3 V DC/4 mA
					Maximum OFF voltage/current 1 V DC/0.5 mA
					Input impedance Approx. 390 Ω
					Minimum input pulse width 100 µs or over
B3	B12		Home input (-)	–	–
B4	B13		COM	–	–
A5	A14		Near home input (DOG)	Input specifications	Operating voltage range 21.6 to 26.4 V DC
					Near home input (DOG) 19.2 V DC/5.0 mA
					Minimum ON voltage/current Limit (+) input (Limit +) Limit (-) input (Limit -) 19.2 V DC/2.6 mA
					Maximum OFF voltage/current 2 V DC/1.5 mA
					Near home input (DOG) Approximately 3.6 kΩ
A6	A15		Limit (+) input (Limit +)	Input specifications	Limit (+) input (Limit +) 19.2 V DC/2.6 mA
			Limit (-) input (Limit -)		Limit (-) input (Limit -) Approximately 6.8 kΩ
B6	B15				Input impedance Approximately 3.6 kΩ

Pin no.		Circuit	Signal name	Items	Description
1st/ 3rd axis	2nd/ 4th axis				
A8	A17		Pulse input A (+)	Input specifications	Operating voltage range 3.5 to 5.25 V DC (5 V DC, line driver specifications)
B8	B17		Pulse input A (-)		Minimum ON voltage/current 3 V DC/3.2 mA
A9	A18		Pulse input B (+)		Maximum OFF voltage/current 1 V DC/0.5 mA
B9	B18		Pulse input B (-)		Input impedance Approx. 390 Ω
					Minimum input pulse width 0.5 μs or over (1 MHz max. on each phase)

Note: Use pulse input signals A and B within the following specifications.

■ **Using pulse input A and B for 2-phase input.**

Pulser input is used for 2-phase input.

■ **Using pulse input A and B for direction discrimination input.**

■ **Using pulse input A and B for individual input.**

3.3 Supply of Power to Drive Internal Circuit

3.3.1 Line Driver Output

The illustration shows one signal component extracted from the overall configuration.

3.3.2 Transistor Output

It is possible to get power for the pulse instruction output circuit from the 5-V DC output terminal (pins A1, A2, A10, and A11).

Note:

Make sure that a current not in excess of 15 mA is provided for each signal in the case of using pulse transistor output (open collector output). Add appropriate resistance if the current exceeds 15 mA.

3.4 Connecting Pulse Instruction Signal Input

3.4.1 Line Driver Output Type

3.4.2 Transistor Output Type

Note:

Make sure that a current not in excess of 15 mA is provided for each signal. Add appropriate resistance if the current is in excess.

The symbol below indicates twisted-pair wiring.

◆ KEY POINTS

- The use of a twisted-pair cable is recommended to connect the output of the positioning unit and the motor driver.

3.5 Connecting Deviation Counter Clear Output Signal

The following diagram shows an example of connection to the counter clear input of the servo motor driver. This connection requires an external power supply of 5 to 24 V DC.

**Note:**

- Be sure to use a twisted-pair cable.
- A maximum of 10 mA can flow as a deviation counter clear output signal. Add appropriate resistance if the current is in excess.

3.6 Connecting Servo On Output Signal

The following diagram shows an example of connection to the servo on of the servomotor driver. This connection requires an external power supply of 5 to 24 V DC.

Note:

- Be sure to use a twisted-pair cable.
- A maximum of 10 mA can flow as a servo ON output signal.
Add appropriate resistance if the current is in excess.

3.7 Connecting Home Input/Near Home Input Signal

3.7.1 Connecting Home Input (Connecting Motor Driver Z-phase Output)

◆ KEY POINTS

- The use of a twisted-pair cable is recommended to connect the output of the positioning unit and the motor driver.

3.7.2 Connecting Home Input (Connecting External Switch Sensor)

3.7.3 Connecting Near Home Input Signal

(Note): B4 and B13 are common to near home input, limit (+) input, limit (-) input, and positioning control start input (timing input).

3.7.4 Connecting Limit Input Signal

(Note): B4 and B13 are common to near home input, limit (+) input, and limit (-) input.

3.8 Connecting Pulse Input

3.8.1 Line Driver Type

3.8.2 Transistor Open Collector Type

3.8.3 Transistor Resistance Pull-up Type

◆ KEY POINTS

The pulser input operation and feedback pulse count of the unit uses the same pulse input terminal. Therefore, select either one of them.

- The use of a twisted-pair cable is recommended.
- In the case of counting 2-phase inputs, such as encoder inputs, use a control code and set the pulse input count to x4 or x2 for the prevention of counting errors.

3.9 Wiring Cautions

Connect the transistor output type or line driver output type to the motor driver over twisted-pair cable within the following wiring distance.

<Signals supported>

- Transistor output
- Line driver output
- Deviation counter clear output

Output type	Model no.	Wiring distance
Transistor output type	AFP7PP02T	10 m
	AFP7PP04T	
Line driver output type	AFP7PP02L	10 m
	AFP7PP04L	

Wiring

4

Power On/Off and Check Items

4.1 Safety Circuit Design

Example of a safety circuit

Installation of the over limit switch

Safety Circuit with Positioning Unit

Install over limit switches as shown above.

Connect the switch to the limit (+) input and limit (-) input of the positioning unit.

External safety circuit

Install the safety circuit recommended by the manufacturer of the motor being used.

4.2 Before Turning On the Power

■ Check items before turning on the power

System configuration example

(1) Checking connections to the various devices

Check and make sure the various devices have been connected as indicated by the design.

(2) Checking the installation of the external safety circuit

Check and make sure the safety circuit (wiring and installation of over limit switch) based on an external circuit has been installed securely.

(3) Checking the safety circuit with the positioning unit

Check the connections of the positioning unit and over limit switch.

Check the installation condition of the over limit switch.

(4) Checking the procedure settings for turning on the power supplies

Make sure settings have been entered so that power supplies will be turned on according to the procedure outlined in section "Procedure for Turning On the Power".

(5) Checking the CPU mode selection switch

Set the CPU unit to PROG. Mode. The CPU unit in RUN mode may operate unexpectedly.

◆ **NOTE**

- The use of the positioning unit requires configuration menu settings. Check that each parameter is set properly.

4.3 Procedure for Turning On the Power

4.3.1 Procedure for Turning On the Power

When turning on the power to the system incorporating the positioning unit, consider the nature and statuses of any external devices connected to the system, and take sufficient care so that turning on the power will not initiate unexpected movements.

Procedure

1. Turn on the power supplies for input and output devices connected to the PLC.
(The power supplies include those for line driver output or open collector output.)
2. Turn on the power supply to the PLC.
3. Turn on the power supply to the motor driver.

4.3.2 Procedure for Turning Off the Power

Procedure

1. Check and make sure the rotation of the motor has stopped, and then turn off the power supply for the PLC.
2. Turn off the power supply to the PLC.
3. Turn off the power supplies for input and output devices connected to the PLC.
(The power supplies include those for line driver output or open collector output.)

4.4 Check with Power Turned On

4.4.1 Check Items After Turning Power On

■ Check items after turning power

On System configuration example

Make checks in the following four major steps.

4.4.2 Check on External Safety Circuit

Make a check on the safety circuit recommended by the motor manufacturer, which includes a check on the disconnection of the power supply to the motor driver with CW and CCW drive inhibition switch input from an external circuit.

4.4.3 Check on Safety Circuit with Positioning Unit

Step 1

Forcibly operate the over limit switch for the positioning safety circuit and check that the positioning unit correctly receives limit input.

The state of limit input can be checked with the input contact. The valid logic of limit input can be changed in the parameter-setting menu of the Configurator PM7.

Step 2

Input a program, if necessary, to perform the JOG operation of the positioning unit. Then forcibly operate limit input and check that the motor will come to a stop.

You can use the tool operation of the Configurator PM7 to make a check without using a program.

Step 3

Perform the JOG operation of the positioning unit and check that the over limit switch will operate normally.

■ Operation at limit input

Condition	Direction	Limit status	Operation
When JOG operation is executed	Forward rotation	Limit input (+):ON	Not executable, Error occurs.
		Limit input (-):ON	Executable
	Reverse rotation	Limit input (+):ON	Executable
		Limit input (-):ON	Not executable, Error occurs.
During JOG operation	Forward rotation	Limit input (+):ON	Deceleration stop, Error occurs.
	Reverse rotation	Limit input (-):ON	Deceleration stop, Error occurs.

4.4.4 Operation Checks on Near Home Switch and Home Switch

Step 1

Forcibly operate home input and near home input and check that the operation indicator of the positioning unit will be lit. Monitor the input contact with the FPWIN GR7 as well and make a similar check.

Step 2

Input a home return program to make an actual home return and check that the positioning unit will perform deceleration with near home input.

Point of confirmation

Set the valid logic of home input and near home input in the parameter-setting menu of the Configurator PM7.

Step 3

Repeat the JOG and home return operation of the positioning unit and check that the home stop position will not shift.

Point of confirmation

A shift may result depending on the position of near home input or home input and the return speed.

Step 4

If the home stopping position is shifted, change the position of near home input or reduce the home return speed.

4.4.5 Checking Rotating and Moving Directions and Moving Distance

Step 1

Confirm the rotating direction and moving direction of the motor by the JOG operation of the positioning unit. Use the tool operation function of the Configurator PM7 and perform the JOG operation of the positioning unit.

Point of confirmation

The rotating direction is determined according to the installation of the ball screw or the CW/CCW direction setting parameter.

Step 2

Perform positioning control and check that the moving distance is correct as designed. Use the tool operation function of the Configurator PM7 and perform the JOG or positioning operation of the positioning unit.

Point of confirmation

The moving distance is determined according to the pitch of the ball screw, deceleration gear ratio, or setting movement amount of the positioning data.

5

Unit Allocation and Parameter Settings

5.1 Unit Allocation

5.1.1 I/O Map Registration

Register the unit with the I/O map before making parameter settings.

◆ PROCEDURE

1. **Select "Options" > "FP7 Configuration" > "I/O map" in the menu bar.**
The "I/O map" dialog box will be displayed.
2. **Double click the desired slot.**
The unit selection dialog box will be displayed.
3. **Select “Positioning” from the unit type, select the name of the unit to be used, and press the [OK] button.**

The message “Updating data display” appears, and the unit selected in the I/O map is registered.

Slot No.	Unit to use	Starting word...
<input type="checkbox"/>	0 S4E CPU unit	0
<input checked="" type="checkbox"/>	1 Line driver type, 4-axis, pulse string	10
<input type="checkbox"/>	2	

5.1.2 Check on I/O Allocation Information

- Each operation start signal, stop signal, home input signal, and positioning completion signal of the positioning unit is allocated to I/O signals.
- I/O numbers actually used vary with the number of the slot where the unit is installed and the first word number.

■ I/O signal allocation (input)

Signal name	I/O number				
	1st axis	2nd axis	3rd axis	4th axis	Virtual axis
Ready positioning	X0				
Tool operation	X4				
Axis group setting done	X5				
Axis parameter setting done	X6				
Recalculation done	X7				
Servo lock	X10	X11	X12	X13	X17
BUSY	X18	X19	X1A	X1B	X1F
Operation done	X20	X21	X22	X23	X27
Home return done	X28	X29	X2A	X2B	X2F
Home input	X30	X31	X32	X33	-
Near home input	X38	X39	X3A	X3B	-
Auxiliary contact	X48	X49	X4A	X4B	X4F
Limit +	X50	X52	X54	X56	-
Limit -	X51	X53	X55	X57	-
Error annunciation	X60	X61	X62	X63	X67
Warning annunciation	X68	X69	X6A	X6B	X6F
Synchronous setting done	X80	X81	X82	X83	-
Synchronous control cancel active annunciation	X88	X89	X8A	X8B	-
Slave axis gear ratio change annunciation	X90	X91	X92	X93	-
Slave axis clutch change annunciation	X98	X99	X9A	X9B	-
Positioning speed change request reception annunciation	X110	X111	X112	X113	X117
Positioning movement amount change request reception annunciation	X118	X119	X11A	X11B	X11F

(Note 1): The I/O numbers in the above table show relative addresses based on the base word number. I/O numbers actually used vary with the number of the slot where the unit is installed and the first word number.

Example) The home input of 1st axis is X130 for slot number 1 if the first word is number 10.

Unit Allocation and Parameter Settings

■ I/O signal allocation (output)

Signal name	I/O number				
	1st axis	2nd axis	3rd axis	4th axis	Virtual axis
System stop	Y0				
Axis group setting change request	Y5				
Axis parameter setting change request	Y6				
Request recalculation	Y7				
Servo ON (The operation is the edge type.)	Y8	Y9	YA	YB	-
Positioning start (The operation is the edge type.)	Y10	Y11	Y12	Y13	Y17
Home return start (The operation is the edge type.)	Y18	Y19	Y1A	Y1B	Y1F
JOG forward rotation (The operation is the level type.)	Y20	Y22	Y24	Y26	Y2E
JOG reverse rotation (The operation is the level type.)	Y21	Y23	Y25	Y27	Y2F
Emergency stop (The operation is the level type.)	Y30	Y31	Y32	Y33	Y37
Deceleration stop (The operation is the level type.)	Y38	Y39	Y3A	Y3B	Y3F
Pulser operation permit (The operation is the level type.)	Y40	Y41	Y42	Y43	Y47
J-point speed change (The operation is the edge type.)	Y48	Y49	Y4A	Y4B	Y4F
Servo OFF request (The operation is the edge type.)	Y50	Y51	Y52	Y53	-
J-point positioning start	Y58	Y59	Y5A	Y5B	Y5F
Request error clear	Y60	Y61	Y62	Y63	Y67
Request warning clear	Y68	Y69	Y6A	Y6B	Y6F
Synchronous setting request	Y80	Y81	Y82	Y83	-
Synchronous cancel request	Y88	Y89	Y8A	Y8B	-
Slave axis gear ratio change request (The operation is the edge type.)	Y90	Y91	Y92	Y93	-
Slave axis clutch ON request	Y98	Y99	Y9A	Y9B	-
Slave axis clutch OFF request	Y100	Y101	Y102	Y103	-
Positioning speed change request	Y110	Y111	Y112	Y113	Y117
Positioning movement amount change request	Y118	Y119	Y11A	Y11B	Y11F

(Note 1): The I/O numbers in the above table show relative addresses based on the base word number. I/O numbers actually used vary with the number of the slot where the unit is installed and the first word number.

Example) The home input of 1st axis is Y110 for slot number 1 if the first word is number 10.

5.2 Axis Allocation for Use

5.2.1 Settings in Configurator PM7

Use the Configurator PM7 to allocate axes for the use of the positioning unit along with the purposes of the axes. The following procedure is explained on the condition that the positioning unit has been already allocated in the I/O map.

◆ PROCEDURE

1. Select the desired positioning unit from the I/O map and press the [Advanced] button.

The configuration menu Configurator PM7 for the positioning unit will start.

Table number	Operation ...	Control...	X axis (virtual...)	Accelerat...	Acceleratio...	Target speed	Dwell time (m)
1	E: End point	I: Incr...	0 L: Linear	100	100	1000	
2	E: End point	I: Incr...	0 L: Linear	100	100	1000	
3	E: End point	I: Incr...	0 L: Linear	100	100	1000	
4	E: End point	I: Incr...	0 L: Linear	100	100	1000	
5	E: End point	I: Incr...	0 L: Linear	100	100	1000	

2. Select “Axis setting” → “Change axis” from the menu bar.

The Axis settings dialog box will be displayed.

3. Select the axes to be used, and press the [OK] button.

The dialog box for the interpolation operation group setting will be displayed.

4. Drag the icon of each axis to be allocated for interpolation to the interpolation group field.

The following picture shows the allocation of 1st axis and 2nd axis to the interpolation group.

5. Press the [OK] button.

A confirmation message will be displayed.

6. Check the contents of the change and press the [Yes] button.

A data table tab each is created for the groups set.

13	E: End point	I: Increment	0 L: Linear	100
14	E: End point	I: Increment	0 L: Linear	100
<input type="button"/> Virtual axis <input type="button"/> <input type="button"/> <input type="button"/> <input type="button"/> <input type="button"/> [A] 1,2Axis <input type="button"/> <input type="button"/> 3Axis <input type="button"/> <input type="button"/> 4Axis <input type="button"/>				

◆ KEY POINTS

- Setting items, such as the movement and interpolation of X-, Y-, and Z-axis, will be added to the data table, and group name [A] or [B] will be displayed on the tab when the interpolation group is set.
- The virtual axis and slave axes under synchronous control cannot be set to the interpolation groups.
- Closing the window with the X mark during editing cancels and stops the operation.

5.3 Parameter Settings

5.3.1 Parameter Settings in Configurator PM7

Use the Configurator PM7 to allocate the most fundamental parameters for positioning control, such as the motor rotation direction, pulse output method (CW/CCW and Pulse/Sign), home input, limit input logic, and positioning control. The following procedure is explained on the condition that the Configurator PM7 has already started.

◆ PROCEDURE

1. Select “Set axis” → “Set parameters” from the menu bar.

The “Parameter settings” dialog box will be displayed.

	Virtual axis	1 axis [A]	2 axis [A]	3 axis	4 axis
Unit setting	Ppulse	Ppulse	Ppulse	Ppulse	Ppulse
Number of pulses per revolution	1	1	1	1	1
Movement per revolution	1	1	1	1	1
Pulse output method	0:Pulse/Sign	0:Pulse/Sign	0:Pulse/Sign	0:Pulse/Sign	0:Pulse/Sign
Pulse output rotation direction	0: Clockwise positive				
Limit switch	N: Disabled				
Limit + switch logic	1:Normal Close	1:Normal Close	0:Normal Open	0:Normal Open	0:Normal Open
Limit - switch logic	1:Normal Close	1:Normal Close	0:Normal Open	0:Normal Open	0:Normal Open
Home position logic	0:Normal Open				
Home position proximity logic	0:Normal Open				
Input Time Constant - Pulse Input	0: No input time constant				

2. Make necessary parameter settings according to the application and press the [OK] button.
3. Select “File” → “Save Config” from the menu bar.

◆ KEY POINTS

- Closing the window with the X mark during editing cancels and stops the operation.

5.3.2 Parameter Setting Items

■ Setting items

Parameter name	Description	Related page
Unit setting	The unit to be used for setting each axis.	4.4 Check with Power Turned On
Number of pulses per rotation	Number of pulses per motor rotation (note 1)	
Movement amount per rotation	Movement amount per motor rotation (note 1)	
Pulse output method	Pulse output method: Pulse/Sign or CW/CCW	
Rotating direction of pulse output	CW direction +: + direction is CW. CCW direction +: + direction is CCW.	
Limit switch	Enable/disable the limit switch.	
Limit+ switch logic	Limit switch logic in the positive direction	
Limit- switch logic	Limit switch logic in the negative direction	
Home logic	Home switch logic	
Near home logic	Near home switch logic	
Input time constant - Pulse input	Set the time constant of each pulse input signal. (Note 2)	—
Input time constant - Home input	Set the time constant of home input signal. (Note 2)	—
Pulse input application	Pulse input application	13.6 Pulse Input
Rotating direction of pulse input	Rotating direction of pulse input (Forward/Reverse)	
Pulse input mode	Mode of pulse input	
Pulse input multiplication	Multiplication of pulse input	
Software limit (positioning control)	Enables/disables the software limit for positioning control.	
Software limit (Home return)	Enables/disables the software limit for home return control.	13.2 Software Limit
Software limit (JOG operation)	Enables/disables the software limit for JOG operation.	
Upper limit of software limit	The upper limit value of the software limit.	
Lower limit of software limit	The lower limit value of the software limit.	
Auxiliary output mode	Operating mode of the auxiliary output contact and auxiliary output code.	13.3 Auxiliary Output Code and Auxiliary Output Contact
Auxiliary output ON time (ms)	The period in which the auxiliary output contact is ON.	
Auxiliary output Delay rate (%)	Rate to perform output when using the delay mode for auxiliary output..	
Movement amount check	Post-check operation with the movement amount check function used	13.6 Pulse Input
Movement amount check value (Pulse)	Check threshold of the movement amount check function	
Numerator of movement amount check correction	The function of movement amount checking is executed based on the pulse input value multiplied by the following ratio. (Numerator of movement amount check correction)/(Denominator of movement amount check correction)	
Denominator of movement amount check correction	Time interval to execute the movement amount check function.	

(Note 1): Set only if the set unit is μm , inch, or degree. It should be cancelled down with the movement amount per rotation.

(Note 2): Available for the unit version Ver.1.3 or later.

◆ KEY POINTS

- In the positioning unit, CW refers to the rotating direction with a count increase and CCW refers to the direction with a count decrease. Therefore, limit input in the CW direction is limit + input and that in the CCW direction is limit -.

Unit Allocation and Parameter Settings

Parameter name	Description	Related page
Startup speed	Startup speed (initial speed) of all types of operation.	13.7 Startup speed
Home return – Return setting code	The pattern of the home return.	10.1 Pattern of Home Return
Home return – Return direction	The operating direction of the home return.	
Home return – Return acceleration time (ms)	The acceleration time of the home return.	
Home return – Return deceleration time (ms)	The deceleration time of the home return.	
Home return – Return target speed	The target speed of the home return.	
Home return – Return creep speed	The speed to search the home position after the proximity input.	
Home return - Home coordinates	Unit system conversion current value after the completion of the home return.	
Home return - Deviation counter clear time (ms)	Output time of deviation counter clear signal	
JOG operation - Acceleration/Deceleration pattern settings	The acceleration/deceleration type of JOG operation.	9.1 Setting and Operation of JOG Operation
JOG operation – Jog acceleration time (ms)	The acceleration time of JOG operation.	
JOG operation – Jog deceleration time (ms)	The deceleration time of JOG operation.	
JOG operation – Target speed	The target rate of JOG operation.	
Emergency stop deceleration time (ms)	The deceleration time when the emergency stop is requested by the input contact.	12.1 Settings and Operations of Stop Functions
Limit stop deceleration time (ms)	The deceleration time of deceleration operation when the limit is input.	
Error stop deceleration time (ms)	The deceleration time of deceleration operation when an error occurs	
J point – Operation setting code	The acceleration/deceleration pattern of the J point (speed point)	7.1 Basic Operation
J point – Acceleration time (ms)	The acceleration pattern of the J point (speed point)	
J point – Deceleration time (ms)	The deceleration pattern of the J point (speed point)	
J point – Target speed	The target speed of the J point (speed point)	
Pulser operation setting code	The pulser input (1 to 4) in the pulser operation.	11.1 Setting and Operation of Pulser Operation
Pulser input method	Input type of pulse operation	
Pulser operation ratio numerator	The number of movement pulses is calculated from the number of input pulses of the pulser multiplied by the ratio below. (Numerator of ratio of pulser operation)/(Denominator of ratio of pulser operation)	13.6 Pulse Input
Pulser operation ratio denominator		
Pulser operation max. speed	The maximum speed of pulse operation	

5.4 Synchronous Parameter/Cam Pattern Settings

5.4.1 Synchronous Parameter Settings

Use the Configurator PM7 to allocate parameters necessary for synchronous control. The following procedure is explained on the condition that the Configurator PM7 has already started.

◆ PROCEDURE

1. Select “Axis Settings” → “Synchronization parameter settings” from the menu bar.

The synchronous parameter dialog box will be displayed.

2. Make necessary parameter settings according to the application and press the [OK] button.

◆ KEY POINTS

- Closing the window with the X mark during editing cancels and stops the operation.

◆ REFERENCE

Refer to Chapter 8: Automatic Operation (Synchronous Control) for parameter settings related to synchronous control.

5.4.2 Cam Pattern Settings

Make electronic cam settings in the case of using an electronic cam. Use the Configurator PM7 to allocate necessary parameters. The following procedure is explained on the condition that the Configurator PM7 has already started.

◆ PROCEDURE

1. Select “Axis Settings” → “Cam pattern settings” from the menu bar.

The cam pattern setting dialog box will be displayed.

2. Make necessary parameter settings according to the application and press the [OK] button.
3. Select “File” → “Save Configuration” from the menu bar.

◆ KEY POINTS

- Parameter information saved can be read on the Configurator PM7.
- In the case of synchronous control, basic parameters related to I/O operate according to 5.3 Parameter Settings.

5.5 Creating Positioning Data Table

5.5.1 Construction of Positioning Data Table

Use the Configurator PM7 to allocate the positioning data table. The following procedure is explained on the condition that the Configurator PM7 has already started.

■ Initial display screen of Configurator PM7

- Sheets are divided for each axis, and 600 tables ranging No. 1 to No. 600 can be set.

The screenshot shows the Configurator PM7 software interface. The menu bar includes File, Edit, View, Online, Debug, Axis Settings, Options, and Help. Below the menu is a toolbar with various icons. The main area displays a table titled 'Positioning data table' with the following columns: Table number, Operation ..., Control..., X axis (virtual...), Accelerat..., Accelerat..., Deceleratio..., Target speed, and Dwell time (ms). The table contains 5 rows of data, each with an 'E: End point' entry in the 'Operation ...' column and 'I: Incr...' entries in the other columns. The 'Target speed' and 'Dwell time' columns show values of 1000 ms for all rows.

Table number	Operation ...	Control...	X axis (virtual...)	Accelerat...	Accelerat...	Deceleratio...	Target speed	Dwell time (ms)
1	E: End point	I: Incr...	O L: Linear	100	100		1000	
2	E: End point	I: Incr...	O L: Linear	100	100		1000	
3	E: End point	I: Incr...	O L: Linear	100	100		1000	
4	E: End point	I: Incr...	O L: Linear	100	100		1000	
5	E: End point	I: Incr...	O L: Linear	100	100		1000	

■ Setting items

Parameter name	Description
Operation pattern	Select one from the following operation patterns. E point: Executes the trapezoidal control of only one table. C point: Executes the trapezoidal control continuously. Specify an end point (E point) at the end of the continuance point (C-point) control. P point: Executes the continuous speed change control. Specify an end point (E point) at the end of the pass point (P-point) control. J point: Executes speed control. Specify an end point (E point) at the end of the speed control (J point).
Control method	Select either increment or absolute coordinate.
X-axis movement amount	Input the movement amount of X-axis. The movement amount depends on the unit system specified in the parameter settings.
Acceleration/deceleration pattern	Select the acceleration/deceleration pattern.
Acceleration time (ms)	Set the acceleration time. Setting unit: ms
Deceleration time (ms)	Set the deceleration time. Setting unit: ms
Target speed	Set the target speed. Set in ms. Setting unit: pps, μ m/s, inch/s, rev/s
Dwell Time (ms)	Set the time from when the positioning instruction in the end point control completes until the positioning done flag turns ON. For the continuance point control, it is the wait time between each table. For the pass point control, the dwell time is ignored.
Auxiliary output	Set the auxiliary output code. When the auxiliary output is set to enable in the parameter settings, the auxiliary output code specified here is output.

(Note 1): The details for the settings in each parameter are indicated in the guidance bar.

(Note 2): In the case of selecting interpolation control, interpolation, Y-axis movement amount, X-axis auxiliary point, Y-axis auxiliary point, and interpolation speed as items are displayed as well.

5.5.2 Table No. Positioning Start

- Execute the POSSET command in the user program to specify table numbers on the Configurator PM7.
- The positioning unit will start control under the conditions set in the table by executing the POSSET reference and turning the corresponding positioning start contact ON after specifying the desired slot number, axis number, and table number.

5.5.3 Operation Patterns and Tables

- Use a number of tables if the positioning patterns consist of pass point control, continuance point control, and JOG positioning control.
- In these types of control, the tables will be created continuously on the Configurator PM7, and select the end point control for the operation pattern for the last table.
- Specify the first data table number for each control in the program.

(Example) Pass point control

Create three positioning data tables, and select “E: End point” for the last table. Furthermore, start the first table number for each control in the user program.

Table number	Operation pattern	Control method	X axis (virtual) movement	Acceleration/deceleration method
1	P: Pass point	I: Increment	50000	L: Linear
2	P: Pass point	I: Increment	100000	L: Linear
3	E: End point	I: Increment	30000	L: Linear

◆ REFERENCE

For detailed information on each control, refer to Chapter 7. Automatic Operation (Positioning Control)

5.6 Saving Parameters

5.6.1 Saving and Loading of Configuration

Information on the basic parameters and positioning data tables that have been set for the Configurator PM7 are saved as configuration information along with information on I/O map allocations on a unit-by-unit basis. Save and load the configuration information as necessary.

- Specified basic parameters and positioning parameters can be saved or loaded on the Configurator PM7.
- Information on positioning parameters and positioning tables saved by using the save function can be reused between projects.

◆ PROCEDURE

1. Select "File" > "Save Setting" from the menu bar.

The saving destination and file names are displayed.

2. Enter the saving destination and file name, and press [Save] button.

Information on the parameters and positioning data tables is saved in a file with a ".pm7" extension.

◆ KEY POINTS

- When "Save Setting" is executed, information on the positioning data tables will be saved along with information set in the parameter setting menu.
- Closing the window with the X mark during editing cancels and stops the operation.
- The menu names of Configurator PM7 have been changed from FPWIN GR7 Ver.2.7.

Menu names of Configurator PM7		Function
FPWINGR7 Ver.2.6 or older	FPWINGR7 Ver.2.7 or later	
New (N)	Initialize Setting (N)	Positioning parameters and positioning data table are newly created on Configurator PM7.
Load Configuration (J)	(None)	
Save Configuration (K)	Apply Setting (K)	Positioning parameters and positioning table data being edited on Configurator PM7 are saved as data being edited.
Import (O)	Read Setting (O)	Saved files (Extension: .pm7) are read.
Export (S)	Save Setting (S)	Data being edited offline on Configurator PM7 is saved as a file (Extension: .pm7).

6

Transfer to Unit and Commissioning

6.1 Check on Setting Contents

6.1.1 Check on Parameter Data

- The following procedure is explained on the condition that the Configurator PM7 has already started.

◆ PROCEDURE

1. Select "Debug" → "Check parameters and data values" from the menu bar.

A message box will be displayed to show the check result. If there is an error in the settings for the positioning data tables, an error message will appear and the cursor will move to the corresponding error position.

6.1.2 Comparison of Parameter Information

- It is possible to compare information on parameters being edited with information saved in the Configurator PM7. The following procedure is explained on the condition that the Configurator PM7 has already started.

◆ PROCEDURE

1. Select "Debug" → "Compare" → "File" or "PLC" from the menu bar.

When "File" is selected, a dialog box for comparison file selection will be displayed.

When "PLC" is selected, information edited in the Configurator PM7 will be compared with configuration information saved in the unit memory (UM) of PLC, and the results of comparison will be displayed.

2. Select the target file from the dialog box for the selection of the comparison file, and press the [OK] button.

The information being edited in the Configurator PM7 is compared with the configuration information saved, and the comparison results will be displayed.

◆ KEY POINTS

- Even if "Save Setting" is executed on Configurator PM7, data will not be saved in the unit memory (UM) of the PLC. When "PLC" is selected as the verification target, verification results may not coincide.
- The menu names of Configurator PM7 have been changed from FPWIN GR7 Ver.2.7.

Menu names of Configurator PM7		Function
FPWINGR7 Ver.2.6 or older	FPWINGR7 Ver.2.7 or later	
File (F)	File (F)	Data being edited on Configurator PM7 is collated with saved files (Extension: .PM7).
Unit (U)	PLC (U)	Data is being edited on Configurator PM7 is collated with data stored in the unit memory (UM) of the PLC.
Config (C)	(None)	

6.2 Transfer of Parameters

6.2.1 Writing Parameters to Unit

- Information on parameters that have been set is transferred as a part of project information to the CPU unit along with other configuration information.
- The following procedure is explained on the condition that the Configurator PM7 has already started.

◆ PROCEDURE

1. **Select “File” → “Exit” from the menu bar of the Configurator PM7.**
2. **When “Save data in the configuration area?” appears, press [Yes(Y)].**
3. **Press the [OK] button in the FP7 configuration dialog box.**
4. **Select “Online” → “Download to PLC” from the FPWIN GR7 menu bar.**

Parameters for the positioning unit will be downloaded to the CPU unit along with the program and other configuration information.

5. **Set the FP7 CPU unit to RUN mode.**

The configuration information will be transferred to the positioning unit so that the positioning unit will be read for commissioning with I/O signals or the Configurator PM7.

6. **Select “Option” → “FP7 configuration” from the menu bar.**

The FP7 configuration dialog box will be displayed.

7. **Select “I/O map” from the left pane.**

8. **Select the positioning unit from the I/O map and press the [Advanced settings (A)] button.**

The Configurator PM7 will be activated.

Select [Online] → [Data monitor] → [Status display] → [Tool operation] so that each menu items of the positioning unit will be available.

6.3 Monitoring on Configurator PM7

6.3.1 Status Monitor

- It is possible to monitor the connection state of each axis and input state of the external terminal.
- The following procedure is explained on the condition that the Configurator PM7 has already started.

◆ PROCEDURE

1. Select “Online” → “Status monitor” from the menu bar.

The status monitor dialog box will be displayed.

6.3.2 Data Monitor

- It is possible to monitor the connection state of each axis and input state of the external terminal.

◆ PROCEDURE

1. Select “Online” → “Data Monitor” from the menu bar.

The data monitor dialog box will be displayed.

■ Monitor items

Items	Description	Related page
Synchronous master axis	When an axis has been set as master axis, "Master" is displayed. When an axis has been set as slave axis, the master axis which this axis follows is displayed. Example) When the second axis has been set as a slave axis for the master of first axis, "1 axis" is displayed in the column of 2 axis. For axes that are not used for the synchronous control, "-----" is displayed.	8.1 Synchronous Control
Synchronous output	The functions of synchronous operation that have been set for slave axes are displayed. Gear, Clutch, Cam Gear+Clutch, Gear+Cam, Clutch+Cam Gear+Clutch+Cam For axes that are not used for the master axes and synchronous control, "-----" is displayed.	
Synchronous state	The states (synchronous/asynchronous) that have been set for each axis are displayed.	
Active table number	The table number that the positioning data is being executed or has been executed.	5.5 Creating Positioning Data Table
Auxiliary output code	When the auxiliary output function is enabled, output code is output within the range of 0 to 65536.	13.3 Auxiliary Output Code and Auxiliary Output Contact
Current value	The current value of the positioning unit is displayed. It will return to "0" on the completion of home return.	13.4 Current Value Update
Unit conversion current value	The unit-converted current value of the positioning unit is displayed. It will return to "0" on the completion of home return. When the coordinate origin has been set, it will be preset to the coordinate origin on the completion of home return.	13.5 Coordinate Origin

Items	Description	Related page
Pulse input value	When the pulse input function is enabled, input pulse values are displayed. In the case of virtual axes, "-----" is displayed.	13.6 Pulse Input
Deviation	When the movement amount automatic check function is enabled, deviations are displayed. In the case of virtual axes, "-----" is displayed.	
Axis state	"Running" or "Stopped" is displayed. When an error has occurred, "Error occurred" is displayed.	
Error code	When an error has occurred, the latest error code is displayed. Pressing the "Clear errors" button clears errors.	15.1 About Errors and Warnings
Warning code	When a warning has occurred, the latest warning code is displayed. Pressing the "Clear warnings" button clears warnings.	

◆ **NOTES**

- **If a recoverable error occurs in the positioning unit, click the [Error clear] button to clear the error.**
- **If a warning occurs in the positioning unit, click [Warning clear] to clear the warning.**

6.4 Tool Operation

6.4.1 Tool Operation Function

- You can perform commissioning with the Configurator PM7 before actually starting the user program.
- Be sure to save the settings and download the project to the CPU unit before starting the tool operation of the positioning unit.
- The following procedure is explained on the condition that the Configurator PM7 has already started.

◆ PROCEDURE

1. Select “Online” → “Tool Operation” from the menu bar.

The tool operation dialog box will be displayed.

■ Types of tool operation

Items	Description
Servo ON/OFF	Specifies servo ON/OFF for each axis.
Home return	A home return is performed to the home of the machine coordinates according to the specified parameter.
Positioning	Moves from the start table number according to the set contents in the positioning table.
JOG operation	The specified axis can be moved to the specified direction at the specified speed while the operation reference is ON.
Teaching	Controls the axis manually like JOG operation, and reflects the resulting positioning address on the Data Editing screen.

◆ KEY POINTS

- The positioning unit cannot go into tool operation while the positioning unit is in user program operation.
- Operation requests with I/O signals will be disabled while the positioning unit is in tool operation.
- If any communication error occurs while the positioning unit is in tool operation, the positioning unit will detect the error and stop automatically. Also, if the previous tool operation does not finish properly due to a communication error, etc., the tool operation mode will be cancelled forcibly when the next tool operation starts. Exit the operation once, and start the tool operation again.

6.4.2 Serve ON/OFF with Tool Operation Function

The following procedure is explained on the condition that the Configurator PM7 has already started.

◆ PROCEDURE

1. Select "Online" > "Tool Operation" from the menu bar.
The "Tool operation" dialog box will be displayed.
2. Select "Servo ON/OFF" in the "Tool operation" dialog box.
The "Servo ON/OFF" dialog box will be displayed.

3. Press the "Change ON/OFF" button for an arbitrary axis.

The state is switched between servo lock and servo free.

4. Confirm the servo ON/OFF states of arbitrary axes, and press the "Close" button.

This returns to the "Tool operation" dialog box.

◆ KEY POINTS

- If the servo ON/OFF has been controlled using ladder programs, the servo-lock or servo-free state before the start of the tool operation is kept and the operation shifts to the tool operation.
- The servo-lock or servo-free state before the completion will be kept even after finishing the tool operation mode.

6.4.3 JOG Operation with Tool Operation Function

- You can perform commissioning with the Configurator PM7 before actually starting the user program.
- The following procedure is explained on the condition that the Configurator PM7 has already started.

◆ PROCEDURE

1. Select “Online” → “Tool Operation” from the menu bar.

The tool operation dialog box will be displayed.

2. Select “JOG operation” from the tool operation dialog box.

The tool operation-JOG operation dialog box will be displayed.

3. Press [+] or [-] button in the JOG field.

The JOG operation of the positioning unit starts.

4. Press [Quit] button to terminate the JOG operation.

◆ KEY POINTS

- If an recoverable error occurs in the positioning unit, click the [Clear errors] button to clear the error.
- If a warning occurs in the positioning unit, click [Clear warning] to clear the warning.
- This dialog box cannot be closed during the operation.

■ Dialog box items

Items	Description	Related page
Synchronous master axis	When an axis has been set as master axis, "Master" is displayed. When an axis has been set as slave axis, the master axis which this axis follows is displayed. Example) When the second axis has been set as a slave axis for the master of first axis, "1 axis" is displayed in the column of 2 axis. Synchronous output	The functions of synchronous operation that have been set for slave axes are displayed. Gear, Clutch, Cam Gear+Clutch, Gear+Cam, Clutch+Cam Gear+Clutch+Cam For axes that are not used for the master axes and synchronous control, "-----" is displayed.	
Synchronous state	The states (synchronous/asynchronous) that have been set for each axis are displayed. Pressing the "Change synchronization" button switches the state between Synchronous and Asynchronous.	
Current value	Monitors the feedback values after the unit system conversion for each axis. Click [Current value update] to display the dialog for inputting value to change the preset value.	13.4 Current Value Update
Unit	The units of position for each axis specified in the parameter settings are displayed.	
Deviation (pulse)	When the movement amount automatic check function is enabled, deviations are displayed. In the case of virtual axes, "0" is displayed when the function is not used.	13.6 Pulse Input
JOG target speed	Monitors and displays the target speed in the JOG operation. Click [Change] to change the target speed for the JOG operation.	9.1 Setting and Operation of JOG Operation
JOG [+]	Click [+] to perform the forward rotation.	9.1 Setting and Operation of JOG Operation
JOG [-]	Click [-] to perform the reverse rotation.	
Axis state	"Running" or "Stopped" is displayed. When an error has occurred, "Error occurred" is displayed.	
Error code	When an error has occurred, the latest error code is displayed. Pressing the "Clear errors" button clears errors.	15.1 About Errors and Warnings
Warning code	When a warning has occurred, the latest warning code is displayed. Pressing the "Clear warnings" button clears warnings.	
Speed rate	The target speed of the JOG operation specified in the parameter settings for each axis is regarded as 100%, and the operation is executed in the specified speed rate. Clicking [Speed Rate] shows the dialog for inputting the value.	

6.4.4 Home Return by Tool Operation Function

- When the power is turned on, the coordinates of the positioning unit do not coincide with those of the machine position. Execute a home return before starting positioning.
- You can perform commissioning with the Configurator PM7 before actually starting the user program.
- The following procedure is explained on the condition that the Configurator PM7 has already started.

◆ PROCEDURE

1. Select “Online” → “Tool Operation” from the menu bar.

The tool operation dialog box will be displayed.

2. Select “Home Return” from the tool operation dialog box.

The tool operation-home return dialog box is displayed.

3. Press the [Start] button for the axis to be returned home.

Execute the home return.

4. Press [Quit] button to terminate the home return operation.

◆ KEY POINTS

- If an recoverable error occurs in the positioning unit, click the [Error Clear] button to clear the error.
- If a warning occurs in the positioning unit, click [Warning clear] to clear the warning.
- This dialog box cannot be closed during the operation.

■ Dialog box items

Items	Description	Related page

Synchronous state	The states (synchronous/asynchronous) that have been set for each axis are displayed. Pressing the "Change synchronization" button switches the state between Synchronous and Asynchronous.	
Current value	Displays the feedback values after the unit system conversion for each axis. Click [Home position coordinate] to display the dialog box for inputting value to change the value after home return.	13.4 Current Value Update
Unit	The units of position for each axis specified in the parameter settings are displayed.	
Deviation (pulse)	When the movement amount automatic check function is enabled, deviations are displayed. In the case of virtual axes, "0" is displayed when the function is not used.	13.6 Pulse Input
Home return mode	Displays the content of the home return setting code registered in the positioning setting data.	10.1 Pattern of Home Return
Start/Stop	Executes the operation to start/stop the home return. - Click [Start] to execute the home return operation. The button name changes to [Stop]. - Click [Stop] to execute the deceleration stop operation. The button name changes to [Start].	
Axis state	"Running" or "Stopped" is displayed. When an error has occurred, "Error occurred" is displayed.	
Error code	When an error has occurred, the latest error code is displayed. Pressing the "Clear errors" button clears errors.	15.1 About Errors and Warnings
Warning code	When a warning has occurred, the latest warning code is displayed. Pressing the "Clear warnings" button clears warnings.	
Speed rate	The target speed of the home return specified in the parameter settings for each axis is regarded as 100%, and the operation is executed in the specified speed rate. Clicking [Speed rate] shows the dialog box for inputting the value.	

6.4.5 Positioning by Tool Operation Function

Specifying a starting table number enables to check if positioning from the starting table operates properly.

◆ PROCEDURE

1. Select “Online” → “Tool Operation” from the menu bar.

The tool operation dialog box will be displayed.

2. Select “Positioning” from the tool operation dialog box.

The tool operation-positioning dialog box will be displayed.

3. Press the [Change] button under the target start table number field.

The dialog box to set the start table number will be displayed.

4. Input the start table number.

5. Press the [Operate] button.

Positioning will start from the specified start table number.

6. Press [Exit] button to terminate the positioning operation.

- When conditions are changed during the tool operation, the unit memory will be updated temporarily and the operation will be performed, however, the changed conditions will not be reflected in the configuration data written in the CPU unit. Therefore, when the mode is changed to the RUN mode again, the unit will start based on the configuration data downloaded to the CPU unit.

◆ KEY POINTS

- For the positioning operation, the setting data should be downloaded to the positioning unit in advance. The operations after the starting table number vary depending on the operation patterns.
- If an recoverable error occurs in the positioning unit, click the [Error clear] button to clear the error.
- If a warning occurs in the positioning unit, click [Warning clear] to clear the warning.
- The positioning operation of the interpolation group starts and stops the axis with the smallest number in the group. If the tool operation function is used, positioning will start by pressing the [Run] button for any axis. A warning message, however, will be displayed unless the [Run] button for the axis with the smallest number is pressed.
- This dialog cannot be closed while the positioning unit is in home return operation.

Items	Description	Related page
Table number executing	Displays the table number during the operation or when it completes.	5.5 Creating Positioning Data Table
Start table number	The starting table number for the positioning control. Click [Change] to change the starting table number.	
Operate/Stop	Execute the operation to start/stop the home return. - Click [Operate] to execute the positioning operation. The button name changes to [Stop]. - Click [Stop] to execute the deceleration stop operation. The button name changes to [Operate].	
Axis state	"Running" or "Stopped" is displayed. When an error has occurred, "Error occurred" is displayed.	
Error code	When an error has occurred, the latest error code is displayed. Pressing the "Clear errors" button clears errors.	15.1 About Errors and Warnings
Warning code	When a warning has occurred, the latest warning code is displayed. Pressing the "Clear warnings" button clears warnings.	
Speed rate	The target speed of the JOG operation specified in the parameter settings for each axis is regarded as 100%, and the operation is executed in the specified speed rate. Clicking [Speed Rate] shows the dialog for inputting the value.	

◆ KEY POINTS

- For the positioning operation, the setting data should be downloaded to the positioning unit in advance. The operations after the starting table number vary depending on the Operation patterns.
- If a recoverable error occurs in the positioning unit, click the [Clear errors] button to clear the error.
- If a warning occurs in the positioning unit, click [Clear warning] to clear the warning.
- The positioning operation of the interpolation group starts and stops the axis with the smalles number in the group. In the case of the tool operation function, the positioning operation starts by pressing the "Operate" button of any axes, however, a warning message is displayed when the "Operate" button other than that for the smallest axis number is pressed.
- This dialog box cannot be closed during the operation.
- When conditions are changed during the tool operation, the unit memory will be updated temporarily and the operation will be performed, however, the changed conditions will not be reflected in the configuration data written in the CPU unit. Therefore, when the mode is changed to the RUN mode again, the unit will start based on the configuration data downloaded to the CPU unit.

6.4.6 Teaching by Tool Operation Function

Activate each axis manually by the tool operation, and register the positioning addresses where the axes come to a stop as the point data.

◆ PROCEDURE

1. Select “Online” → “Tool Operation” from the menu bar.

The tool operation dialog box will be displayed.

2. Select “Teaching” from the tool operation dialog box.

The tool operation-teaching dialog box will be displayed.

3. Perform the JOG operation of the positioning unit to stop the positioning unit at the positioning point.

4. Press the [Teaching] button.

5. Input the table number where the desired positioning information is registered, and click the [OK] button.

The current value will be registered for the amount of movement of the table number specified. If the axis that the teaching operation is performed is the interpolation axis, the current value is registered for the movement amount of the equivalent coordinate in the interpolation group.

6. Press [Exit] button to terminate teaching.

■ Dialog box items

Items	Description	Related page
Synchronous master axis	When an axis has been set as master axis, "Master" is displayed. When an axis has been set as slave axis, the master axis which this axis follows is displayed. Deviation (pulse)	When the movement amount automatic check function is enabled, deviations are displayed. In the case of virtual axes, "0" is displayed when the function is not used.	13.6 Pulse Input
JOG target speed	Monitors and displays the target speed in the JOG operation. Click [Change] to change the target speed for the JOG operation.	9.1 Setting and Operation of JOG Operation
JOG [+]	Click [+] to perform the forward rotation.	
JOG [-]	Click [-] to perform the reverse rotation.	
Table No.	Displays the table number to perform the teaching. Click [Teaching] to change the table number for the teaching and register the current value.	5.5 Creating Positioning Data Table
Axis state	"Running" or "Stopped" is displayed. When an error has occurred, "Error occurred" is displayed.	
Error code	When an error has occurred, the latest error code is displayed. Pressing the "Clear errors" button clears errors.	15.1 About Errors and Warnings
Warning code	When a warning has occurred, the latest warning code is displayed. Pressing the "Clear warnings" button clears warnings.	
Speed rate	The target speed of the home return specified in the parameter settings for each axis is regarded as 100%, and the operation is executed in the specified speed rate. Clicking [Speed Rate] shows the dialog for inputting the value.	

◆ KEY POINTS

- If an recoverable error occurs in the positioning unit, click the [Error clear] button to clear the error.
- If a warning occurs in the positioning unit, click [Warning clear] to clear the warning.
- The control method for the table number that the teaching operation was performed is automatically changed to “Absolute”.
- The result of the teaching becomes effective once the tool operation quits and the setting data is downloaded to the positioning unit.
- This dialog cannot be closed while the positioning unit is in home return operation.

Transfer to Unit and Commissioning

7

Automatic Operation (Positioning Control)

7.1 Basic Operation

7.1.1 Positioning Control Patterns

■ Type of operations

The automatic operation is an operation mode to perform positioning control. A single axis control and an interpolation control that starts and stops multiple axes simultaneously are available for positioning control.

End point (E-point) control, which uses the positioning data of a single table, and pass point (P-point) control and continuous point (C-point) control, both of which use multiple tables, are available for single axis control and interpolation control. These types of control are described below, and acceleration time and deceleration time can be set individually. For P-point control and C-point control, an E-point should be set as the last table. In P-point control and C-point control, the operation done flag turns ON after the last table is executed.

JOG positioning (J-point) control (i.e., speed control) is available in addition to P-point control, C-point control, and E-point control.

J-point control operates until the start contact of J-point positioning turns ON after the operation of the positioning unit starts, and the next positioning control will start when the start contact of J-point positioning turns ON.

In J-point control, the operation done flag turns ON after the last table is executed.

J-point control can be used for a single axis only.

■ Operation flow of single axis control

Use the Configuration menu and set the target axis as a single axis.

Use the Configuration menu and set the target positioning data.

Download the project to the CPU unit.

Set the POSSET command and set the target positioning control starting table.

Turn the corresponding positioning start contact ON.

■ Operation flow of interpolation control

Use the Configuration menu and set the axes subject to interpolation as a group.

Use the Configuration menu and set the target positioning data. Set the center point and pass point as well in circular interpolation or spiral interpolation.

Download the project to the CPU unit.

Use the POSSET command for the axis with the smallest number in the group and set the target positioning control starting table.

Turn ON the corresponding positioning start contact of the axis with the smallest number in the group.

7.1.2 Setting and Operation of E-point Control

The example below is a case of single-axis control with the positioning unit installed in slot 1. The movement amount setting uses an increment method in pulses.

■ Settings

Items	Setting example
Operation pattern	E: End point
Control method	I: Increment
X-axis movement amount	10000 pulses
Acceleration/deceleration pattern	L: Linear
Acceleration time (ms)	100 ms
Deceleration time (ms)	100 ms
Target speed	10000 pps

■ Operation diagram

■ Operation of each contact

- The BUSY flag (X118), which indicates that the motor is running, will turn ON when the positioning control starts, and it will turn OFF when the operation completes.
- The operation done flag (X120), which indicates the completion of operation, will turn ON when the current operation is completed, and it will be held until the next positioning control, JOG operation, home return, or pulser operation starts. The flag will turn ON after the positioning unit transmits a reference for the target position.

7.1.3 Setting and Operation of P-point Control

The example below is a case of single-axis control with the positioning unit installed in slot 1. The movement amount setting uses an increment method in pulses.

■ Settings

Items	Setting example		
	Table 1	Table 2	Table 3
Operation pattern	P: Pass point	P: Pass point	E: End point
Control method	I: Increment	I: Increment	I: Increment
X-axis movement amount	5000 pulses	10000 pulses	3000 pulses
Acceleration/deceleration pattern	L: Linear	L: Linear	L: Linear
Acceleration time (ms)	100 ms	200 ms	30 ms
Deceleration time (ms)	10 ms	20 ms	150 ms
Target speed	10000 pps	20000 pps	5000 pps

■ Operation diagram

■ Operation of each contact

- The BUSY flag (X118), which indicates that the motor is running, will turn ON when the positioning control starts, and it will turn OFF when the operation completes.
- The operation done flag (X120), which indicates the completion of operation, will turn ON when the current operation is completed, and it will be held until the next positioning control, JOG operation, home return, or pulser operation starts. The flag will turn ON after the positioning unit transmits a reference for the target position.

7.1.4 Setting and Operation of C-point Control

The example below is a case of single-axis control with the positioning unit installed in slot 1. The movement amount setting uses an increment method in pulses.

■ Settings

Use the tool software to make positioning data and parameter settings. The unit is set to pulse.

Items	Setting example		
	Table 1	Table 2	Table 3
Operation pattern	C: Continuance point	C: Continuance point	E: End point
Control method	I: Increment	I: Increment	I: Increment
X-axis movement amount	5000 pulses	10000 pulses	3000 pulses
Acceleration/deceleration pattern	L: Linear	L: Linear	L: Linear
Acceleration time (ms)	100 ms	200 ms	30 ms
Deceleration time (ms)	10 ms	20 ms	150 ms
Target speed	10000 pps	20000 pps	5000 pps

■ Operation diagram

■ Operation of each contact

- The **BUSY flag (X118)**, which indicates that the motor is running, will turn ON when the positioning control starts, and it will turn OFF when the operation completes.
- The **operation done flag (X120)**, which indicates the completion of operation, will turn ON when the current operation is completed, and it will be held until the next positioning control, JOG operation, home return, or pulser operation starts. The flag will turn ON after the positioning unit transmits a reference for the target position.

7.1.5 Setting and Operation of J-point Control

- JOG positioning (J-point) control operates at target speed until the start contact of J-point positioning turns ON after the operation of the positioning unit starts, and the next positioning control will start when the start contact of J-point positioning turns ON.

■ Settings

Items	Setting example			
	Table 1	J-point axis parameter setting	Table 2	Table 3
Operation pattern	J: Speed point	–	P: Pass point	E: End point
Control method	I: Increment	–	I: Increment	I: Increment
X-axis movement amount	5000 pulses	–	10000 pulses	3000 pulses
Acceleration/deceleration pattern	L: Linear	–	L: Linear	L: Linear
Acceleration time (ms)	100 ms	–	200 ms	30 ms
Deceleration time (ms)	10 ms	–	20 ms	150 ms
Target speed	10000 pps	–	20000 pps	5000 pps
J-point operation setting code	–	Linear acceleration/deceleration	–	–
J-point acceleration time (ms)	–	10 ms	–	–
J-point deceleration time (ms)	–	10 ms	–	–
J-point target speed	–	30000 pps	–	–

◆ KEY POINTS

- Specify parameters for the start of operation in the positioning data table. Specify parameters in the axis parameter-setting menu at the time of speed change.
- J-point control can be used for single-axis control only. It is not available for interpolation control.
- Set the positioning unit to increment mode to implement P-point control, C-point control, or E-point control with positions specified after J-point control is implemented.
- Speed control is performed while the positioning unit is in J-point control, in which case, be sure to input the amount of movement for positioning with a value that can secure a target constant-speed area.

■ Operation diagram

■ Operation of each contact

- The BUSY flag (X118) will turn ON when the operation starts and turn OFF when the operation is completed.
- The operation done flag (X120) indicating the state that an operation completed will turn ON when the JOG operation is completed, and it will be held until the next positioning control, JOG operation, home return, or pulser operation starts.
- The target speed will be changed when the J-point speed change contact (Y148) turns ON. The change will be enabled at the edge where the contact turns ON.
- Positioning control will start when J-point positioning start contact (Y158) turns ON.

■ Behaviors when the speed change contact turns ON while the positioning unit is accelerating or decelerating the speed

- A speed change is possible during J-point control, but impossible during acceleration or deceleration.
- A speed change will be made after the positioning unit goes to constant speed when the speed change signal turns ON during acceleration or deceleration.

7.1.6 Sample Program (E-point, P-point, and C-point Control)

■ Sample program

7.1.7 Sample Program (J-point Control)

■ Sample program

7.1.8 Programming Precautions

■ Programming Precautions

- The last table should be set to E: End point.
- If any value such as a movement amount, acceleration time, deceleration time or target speed is out of the specified range, a set value error will occur when the positioning control starts.
- The start contact and flag number varies depending on the number of axes and the installation position of the unit.
- The specified slot number varies depending on the installation position of the unit.

■ Operation at limit input

Condition	Direction	Limit status	Operation
At each control start	Forward rotation	Limit input (+):ON	Not executable, Error occurs.
		Limit input (-):ON	Not executable, Error occurs.
	Reverse rotation	Limit input (+):ON	Not executable, Error occurs.
		Limit input (-):ON	Not executable, Error occurs.
During each type of control	Forward rotation	Limit input (+):ON	Deceleration stop, Error occurs.
	Reverse rotation	Limit input (-):ON	Deceleration stop, Error occurs.

7.2 Interpolation Control

7.2.1 Types of Interpolation Control

■ Types of operations

Interpolation control includes 2-axis linear interpolation control, 2-axis circular interpolation control, 3-axis linear interpolation control, and 3-axis spiral interpolation control. The following methods are available to specify the operation of each interpolation control. Select an appropriate method according to the application. The axes in the relation of interpolation are called X-axis and Y-axis for the 2-axis interpolation, and are called X-axis, Y-axis, and Z-axis for the 3-axis interpolation. X-, Y-, and Z-axes are automatically assigned in ascending order of axis signal levels.

In each type of interpolation control, the E-point control that uses one table, P-point control and C-point control that uses multiple tables can be combined arbitrarily as positioning data.

For example, using P-point control enables continuous interpolation control from 2-axis linear control to 2-axis circular interpolation control. The acceleration time and deceleration time can be specified individually. For P-point control and C-point control, an E point should be set as the last table.

Type	Operation specification method	Necessary data
2-axis linear interpolation control	Composite speed	Composite speed of X-axis and Y-axis
	Long axis speed	Speed of long axis (Axis of which moving distance is long)
2-axis circular interpolation control	Center/CW direction	X-axis and Y-axis coordinates of center
	Center specified/CCW direction	X-axis and Y-axis coordinates of center
	Pass point	X-axis and Y-axis coordinate of pass point on arc
3-axis linear interpolation control	Composite speed	Composite speed of X-axis, Y-axis, and Z-axis
	Long axis speed	Speed of long axis (Axis of which moving distance is long)
3-axis spiral interpolation control	Center/CW direction/X-axis movement	Y-axis and Z-axis coordinates of center
	Center/CCW direction/Y-axis movement	Y-axis and Z-axis coordinates of center
	Center/CW direction/Y-axis movement	X-axis and Z-axis coordinates of center
	Center/CCW direction/Y-axis movement	X-axis and Z-axis coordinates of center
	Center/CW direction/Z-axis movement	X-axis and Y-axis coordinates of center
	Center/CCW direction/Z-axis movement	X-axis and Y-axis coordinates of center
	Pass point/X-axis movement	Y-axis and Z-axis coordinate of pass point on arc
	Pass point/Y-axis movement	X-axis and Z-axis coordinate of pass point on arc
	Pass point/Z-axis movement	X-axis and Y-axis coordinate of pass point on arc

Automatic Operation (Positioning Control)

3-axis linear interpolation
(Composite speed specification)

3-axis linear interpolation
(Long axis speed specification)

3-axis spiral interpolation (Center point specification/
CW direction/Z-axis movement)

3-axis spiral interpolation (Center point specification/
CCW direction/Z-axis movement)

3-axis spiral interpolation (Pass point specification/
Z-axis movement)

When the X-axis and Y-axis is the moving axes, each axis in the above diagram is replaced.

7.2.2 Setting and Operation of 2-Axis Linear Interpolation

The example below is a case of E-point control with the positioning unit installed in slot 1. The X-axis is set to the 1st axis and the Y-axis is set to the 2nd axis. The movement amount setting is the increment method in pulses.

■ Settings

Items	Setting example
Operation pattern	E: End point
Interpolation operation	0: Linear (Composite speed)
Control method	I: Increment
X-axis movement	10000 pulses
X-axis auxiliary point	0
Y-axis movement	5000 pulses
Y-axis auxiliary point	0
Acceleration/deceleration method	L: Linear
Acceleration time (ms)	100 ms
Deceleration time (ms)	100 ms
Interpolation speed	10000 pps

■ Operation diagram

■ Operation of each contact

- The 1st axis and 2nd axis BUSY flags (X118 and X119) indicating the state that a motor is running will turn ON when the positioning control starts, and they will turn OFF when the operation completes.
- The 1st axis and 2nd axis operation done flags (X120 and X121) indicating the state that an operation completed will turn ON when the JOG operation is completed, and they will be held until the next positioning control, JOG operation, home return, or pulser operation starts.

■ Programming Precautions

- To start the interpolation control, turn ON the positioning start contact of the axis with the smallest number in the same group.
- The values of the X-axis auxiliary point and Y-axis auxiliary point are invalid for the linear interpolation.
- In the case of specifying long axis speed, the composite speed will be faster than the long axis speed.
- If any value such as a movement amount, acceleration time, deceleration time or target speed is out of the specified range, a set value error will occur when the positioning control starts.
- The start contact and flag number varies depending on the number of axes and the installation position of the unit.
- The specified slot number varies depending on the installation position of the unit.

7.2.3 Setting and Operation of 2-Axis Circular Interpolation

The example below is a case of E-point control with the positioning unit installed in slot 1. The X-axis is set to the 1st axis and the Y-axis is set to the 2nd axis. The movement amount setting is the increment method in pulses.

■ Settings

Use the tool software to make positioning data and parameter settings. The unit is set to pulse.

Items	Setting example
Operation pattern	E: End point
Interpolation operation	S: Circular (Pass point/CW direction)
Control method	I: Increment
X-axis movement	0 pulse
X-axis auxiliary point	0 pulse
Y-axis movement	20000 pulses
Y-axis auxiliary point	10000 pulses
Acceleration/deceleration pattern	L: Linear
Acceleration time (ms)	100 ms
Deceleration time (ms)	100 ms
Interpolation speed	10000 pps

■ Operation diagram

■ Operation of each contact

- The 1st axis and 2nd axis BUSY flags (X118 and X119) indicating the state that a motor is running will turn ON when the positioning control starts, and they will turn OFF when the operation completes.
- The 1st axis and 2nd axis operation done flags (X120 and X121) indicating the state that an operation completed will turn ON when the JOG operation is completed, and they will be held until the next positioning control, JOG operation, home return, or pulser operation starts.

■ Programming Precautions

- To start the interpolation control, turn ON the positioning start contact of the axis with the smallest number in the same group.
- In the case of the center point specification, the X-axis auxiliary point is the center point of X-axis, and the Y-axis auxiliary point is the center point of Y-axis. In the case of the pass point, each pass point is set as the pass point of X-axis and Y-axis.
- When the control method is increment, both the center point and pass point will be increment coordinates from the start point.
- When the start point and the operation done point is the same, it performs one circular operation when using the center point method. However, when using the pass point method, an error will occur.
- In the case of the pass point method, when the start point, pass point, and operation done point exist in the same straight line, an arc will not be comprised and an error will occur.
- In the case of specifying long axis speed, the composite speed will be faster than the long axis speed.
- If any value such as a movement amount, acceleration time, deceleration time or target speed is out of the specified range, a set value error will occur when the positioning control starts.
- The start contact and flag number varies depending on the number of axes and the installation position of the unit.
- The specified slot number varies depending on the installation position of the unit.

7.2.4 Setting and Operation of 3-Axis Linear Interpolation

The example below is a case of E-point control with the positioning unit installed in slot 1. The X-axis is set to the 1st axis, the Y-axis is set to the 2nd axis, and the Z-axis is set to the 3rd axis. The movement amount setting is the increment method, and the unit is set to pulse.

■ Settings

Items	Setting example
Operation pattern	E: End point
Interpolation operation	0: Linear (Composite speed)
Control method	I: Increment
X-axis movement amount	10000 pulses
X-axis auxiliary point	0
Y-axis movement amount	5000 pulses
Y-axis auxiliary point	0
Z-axis movement amount	20000 pulses
Z-axis auxiliary point	0
Acceleration/deceleration pattern	L: Linear
Acceleration time (ms)	100 ms
Deceleration time (ms)	100 ms
Interpolation speed	10000 pps

■ Operation diagram

■ Operation of each contact

- The 1st axis, 2nd axis, and 3rd axis BUSY flags (X118, X119, and X11A) indicating the state that a motor is running will turn ON when the positioning control starts, and they will turn OFF when the operation completes.
- The 1st axis, 2nd axis, and 3rd axis operation done flags (X120, X121, and X122) indicating the state that an operation completed will turn ON when the JOG operation is completed, and they will be held until the next positioning control, JOG operation, home return, or pulser operation starts.

■ Programming Precautions

- To start the interpolation control, turn ON the positioning start contact of the axis with the smallest number in the same group.
- The values of the X-axis auxiliary point and Y-axis auxiliary point are invalid for the linear interpolation.
- In the case of specifying long axis speed, the composite speed will be faster than the long axis speed.
- If any value such as a movement amount, acceleration time, deceleration time or target speed is out of the specified range, a set value error will occur when the positioning control starts.
- The start contact and flag number varies depending on the number of axes and the installation position of the unit.
- The specified slot number varies depending on the installation position of the unit.

7.2.5 Setting and Operation of Three-Axis Linear Interpolation

The example below is a case of E-point control with the positioning unit installed in slot 1. The X-axis is set to the 1st axis, the Y-axis is set to the 2nd axis, and the Z-axis is set to the 3rd axis. The movement amount setting is the increment method, and the unit is set to pulse.

■ Settings

Items	Setting example
Operation pattern	E: End point
Interpolation operation	E: Spiral (Center/CW direction/Z-axis movement)
Control method	I: Increment
X-axis movement amount	0 pulse
X-axis auxiliary point	0 pulse
Y-axis movement amount	20000 pulses
Y-axis auxiliary point	10000 pulses
Z-axis movement amount	5000 pulses
Z-axis auxiliary point	0
Acceleration/deceleration pattern	L: Linear
Acceleration time (ms)	100 ms
Deceleration time (ms)	100 ms
Interpolation speed	10000 pps

■ Operation diagram

■ Operation of each contact

- The 1st axis, 2nd axis, and 3rd axis BUSY flags (X118, X119, and X11A) indicating the state that a motor is running will turn ON when the positioning control starts, and they will turn OFF when the operation completes.
- The 1st axis, 2nd axis, and 3rd axis operation done flags (X120, X121, and X122) indicating the state that an operation completed will turn ON when the JOG operation is completed, and they will be held until the next positioning control, JOG operation, home return, or pulser operation starts.

Programming Precautions

- For X-Y plane, in the case of the center point specification, the X-axis auxiliary point is the center point of X-axis, and the Y-axis auxiliary point is the center point of Y-axis. In the case of the pass point, each pass point is set as the pass point of X-axis and Y-axis. These settings are the same for Y-Z plane and X-Z plane.
- When the control method is increment, both the center point and pass point will be increment coordinates from the start point.
- When the start point and the operation done point is the same, it performs one circular operation when using the center point method. However, when using the pass point method, an error will occur.
- In the case of the pass point method, when the start point, pass point, and operation done point exist in the same straight line, an arc will not be comprised and an error will occur.
- In the case of specifying long axis speed, the composite speed will be faster than the long axis speed.
- If any value such as a movement amount, acceleration time, deceleration time or target speed is out of the specified range, a set value error will occur when the positioning control starts.
- The start contact and flag number varies depending on the number of axes and the installation position of the unit.
- The specified slot number varies depending on the installation position of the unit.

7.2.6 Sample Program (Interpolation Control)

An example of 3-axis interpolation control is shown below.

■ Sample program

7.3 Setting and Operation of Positioning Repeat Function

The positioning repeat function enables continuous positioning control according to the number of repetitions specified.

The number of repetitions is set in the area for the number of positioning repetitions on each axis. The number of repetitions can be set within a range of 2 to 254. It is possible to specify a limitless number of repetitions by setting 255 for the area of the number of positioning repetitions.

■ Outline of Positioning Repeat Function

The positioning unit operates as shown below in the case of repeating positioning control three times.

If a dwell time of 0 is set for E-point control, i.e., the end point of positioning control, the positioning unit will perform E-point control as P-point control, and complete positioning control after repeating positioning control three times continuously.

If the dwell time is set to a value other than 0 for E-point control, i.e., the end point of positioning control, the positioning unit will perform E-point control as C-point control, and repeat positioning control with a pause specified by the dwell time (ms).

The positioning unit will finish operating after repeating positioning control three times.

■ Setting area for positioning repeat function

Set the number of repetitions of positioning control per axis before starting positioning control. The positioning unit repeats positioning control for the number of repetitions set and finishes operating. The number of repetitions will be reset to the default value on completion of positioning control.

Unit memory no. (Hex)	Name	Description	Default	Setting range	Set unit
UM 00108	Number of 1st axis positioning repetitions	Stores the number of repetitions starting from the starting table number of positioning control of the 1st axis until the E point. If 255 is stored, the positioning unit repeats positioning control an unlimited number of times until you manually stop the operation.	0	0 to 255	Times
UM 00109	Number of 2nd axis positioning repetitions	Stores the number of repetitions starting from the starting table number of positioning control of the 2nd axis until the E point. If 255 is stored, the positioning unit repeats positioning control an unlimited number of times until you manually stop the operation.	0	0 to 255	Times
UM 0010A	Number of 3rd axis positioning repetitions	Stores the number of repetitions starting from the starting table number of positioning control of the 3rd axis until the E point. If 255 is stored, the positioning unit repeats positioning control an unlimited number of times until you manually stop the operation.	0	0 to 255	Times
UM 0010B	Number of 4th axis positioning repetitions	Stores the number of repetitions starting from the starting table number of positioning control of the 4th axis until the E point. If 255 is stored, the positioning unit repeats positioning control an unlimited number of times until you manually stop the operation.	0	0 to 255	Times
UM 0010F	Number of virtual axis positioning repetitions	Stores the number of repetitions starting from the starting table number of positioning control of the virtual axis until the E point. If 255 is stored, the positioning unit repeats positioning control an unlimited number of times until you manually stop the operation.	0	0 to 255	Times

■ Interruption of repetitive positioning

The following operation will occur only if the positioning unit in repetitive positioning control is decelerated to stop.

- **Repeating E-point control (with dwell time: 0 ms)**

When the positioning unit detects a deceleration stop, the positioning unit will come to a stop after repeating positioning control N+2 times.

- **Implementing a number of positioning tables continuously**

When the positioning unit detects a deceleration stop, the positioning unit will come to a stop after repeating positioning control N+1 times.

The example below is a case of single-axis control with the positioning unit installed in the slot 1. The movement amount setting uses an increment method in pulses.

■ Settings

Items	Setting example		
	Table 1	Table 2	Table 3
Operation pattern	P: Pass point	P: Pass point	E: End point
Control method	I: Increment	I: Increment	I: Increment
X-axis movement amount	5000 pulses	10000 pulses	3000 pulses
Acceleration/deceleration pattern	L: Linear	L: Linear	L: Linear
Acceleration time (ms)	100 ms	200 ms	30 ms
Deceleration time (ms)	10 ms	20 ms	150 ms
Target speed	10000 pps	20000 pps	5000 pps
Dwell Time (ms)	0 ms	0 ms	0 ms
Number of positioning repetitions	3 (written to the setting area of the unit memory)		

■ Operation diagram

■ Operation of each contact

- The BUSY flag (X118), which indicates that the motor is running, will turn ON when the positioning control starts, and it will turn OFF when the operation completes.
- The operation done flag (X120), which indicates the completion of operation, will turn ON when the current operation is completed, and it will be held until the next positioning control, JOG operation, home return, or pulser operation starts.

■ Sample program

8

Automatic Operation (Synchronous Control)

8.1 Synchronous Control

8.1.1 Outline of Synchronous Control

■ Synchronous control

The positioning unit in synchronous control operates a master axis so that slave axis will operate in synchronization with the master axis. The use of synchronous control provides the following merits.

1. Ease of setting

A number of related axes can be operated with ease by designing the operation of the axes based on the master axis.

2. Ensuring operational safety

If an axis comes to a stop for some reason while the positioning unit is in synchronous control, all the relevant axes under synchronous control will come to a stop. Therefore, you can easily increase the safety of the positioning unit.

■ Outline of Synchronous Control

The synchronous control provides the following functions. These functions are executed in order, and the slave axes operate according to the operation result of each function.

Functions	Outline
Electronic gear	The number of pulses multiplied by the preset electronic gear ratio is output according to the operation of the master axis.
Electronic clutch	The operation of the slave axes can be separated from the operation of the master axis by disengaging the clutch.
Electronic cam	A function to output pulses according to the preset cam pattern. Calculates the operation phase of the master axis and outputs cam pulses according to the phase. The cam pattern is set with a setting tool.

■ Execution Order of Synchronous Control and Setting Procedures

The following section provides information on the outline of functions achieved by synchronous control and setting procedures for the functions.

8.2 Settings for Master and Slave Axes

8.2.1 Selection of Master Axis and Settings

The master axis serves as a reference for synchronization control. Start and stop requests for various operations are made to the master axis under synchronous control. It is possible to select one of the following master axes.

■ Types of master axis

Type	Outline
Existing axis	<p>Axes (the 1st to 4th axes) available for the positioning unit. Use one of them if the master axis needs to be an object of control as well. If an existing axis is used as the master axis, the rest of the existing axes (three axes) can be used as slave axes.</p>
Virtual axis	<p>A virtual axis exists in the positioning unit. The existing axes (1st to 4th axes) can be used effectively if the virtual axis is used. The virtual axis cannot output pulses externally. The virtual axis cannot receive any external input signals, either.</p>
Pulse input	<p>The master axis operates according to pulse value input into the positioning unit. Use pulse input in the case of connecting an external device, such as an encoder, for the reference of synchronous control. In the case of using pulse input as the master axis, the slave axes will operate according to the pulse input. Therefore, be careful when starting or stopping the operation of the positioning unit.</p>

■ Types and restrictions of master axis

		Type		
		Existing axis	Virtual axis	Pulse input
Home return		m	Available to data setting only.	No
JOG operation		Yes	Yes	No
Positioning	Single axis	Yes	Yes	No
	Interpolation	Yes	No Available to single axis only.	No
Stop functions	System/Emergency/ Deceleration stop	Yes	Yes	No
	Limit stop	Yes	Questionable Stops only with software limit because of no limit signal input.	No
	Error stop	Yes	Yes	No
Others			Necessary to make settings to use the virtual axis on the Configuration screen.	Synchronizes with external pulse input, and no master axis control is possible. To stop synchronous control, stop the slave axes.

◆ KEY POINTS

- While the positioning unit is in synchronous control, slave axes set to use the master axis will operate only in synchronization with the master axis, i.e., the slave axes cannot operate independently.
- The virtual axis is assigned to a single axis only. In the case of using the virtual axis, check the box for the virtual axis in the dialog box to set the operating axes on the Configurator PM7.
- The home return of the virtual axis is possible only by data setting.
- If pulse input is set for the master axis, the master axis will synchronize with pulse input from an external device, such as an encoder. Therefore, the master axis cannot be stopped arbitrarily.

8.2.2 Selection of Slave Axes and Settings

■ Selection of Slave Axes

The 1st to 4th axes are available as slave axes. The virtual axis can be used only as the master axis.

When “Synchronous master axis” is selected in the synchronous parameter dialog box of the Configurator PM7, the corresponding axis will operate as a slave axis for the specified master axis.

Up to four slave axes can be set for a single master axis.

Axes set as slave axes operate in synchronization with the master axis as long as synchronous control is enabled. No slave axes can perform positioning and other control independently from the master axis while synchronous control is enabled.

■ Settings for Slave Axes

The slave axes operate in synchronization with the master axis. Set the following items, however, for each individual slave axis.

- Unit setting
- Number of pulses per rotation
- Movement amount per rotation

8.2.3 Enabling/Disabling Synchronous Control

■ Settings to Enable/Disable Synchronous Control

- It is possible to cancel the synchronous state temporarily with a sync cancel request signal turned ON.
- It is possible to operate any slave axes individually while the synchronous state is canceled.
- The slave axes will go into the state of synchronization again with the sync cancel request signal turned OFF.

■ I/O signal allocation

Signal name	1st axis	2nd axis	3rd axis	4th axis	Operation
Synchronous cancel request	Y88	Y89	Y8A	Y8B	ON: Cancel synchronous control; OFF: Execute synchronous control
Synchronous cancel alarm	X88	X89	X8A	X8B	ON: Synchronous control canceled; OFF: Under synchronous control

Automatic Operation (Synchronous Control)

■ Difference between synchronous control enabled/disabled

Operation request axis		Operates with synchronous control enabled		Operates with synchronous control disabled
		Master axis set	Slave axis set	Master/Slave axis set
Home return		<p>No</p> <p>The master axis performs a home return.</p> <p>The slave axes do not perform a home return but operate in synchronization with output from the master axis.</p> <p>To enable the slave axes to perform a home return, operate them with synchronous control disabled.</p>	No	<p>Yes</p> <p>The master axis or slave axes will perform a home return only if the master axis or the slave axes are so requested.</p>
JOG operation		<p>Yes</p> <p>The slave axes operate in synchronization with the operation request of the master axis.</p>	<p>No</p> <p>The slave axes do not operate in response to operation requests.</p>	<p>Yes</p> <p>The master axis or slave axes will go into JOG operation only if the master axis or the slave axes are so requested.</p>
Positioning	Single axis	<p>Yes</p> <p>Interpolation will be executed upon request if the master axis is the start axis of interpolation.</p>		<p>Yes</p> <p>Interpolation will be executed upon request if the requested axis is the start axis of interpolation.</p>
	Interpolation	<p>The slave axes operate in synchronization with the master axis.</p>		
Stop functions	System stop	All the axes come to a stop regardless of the synchronization settings.		
	Emergency stop	<p>Yes</p> <p>The master axis comes to a stop upon request.</p>	<p>Yes</p> <p>Only axes requested come to a stop.</p>	<p>Yes</p> <p>Only axes requested come to a stop.</p>
	Deceleration stop	<p>The slave axes come to a stop in synchronization with the master axis.</p>	<p>The master axis and other slave axes set on the same master axis continue operating.</p>	<p>(All the axes in interpolation operation come to a stop.)</p>
	Limit stop	The master axis and all the slave axes come to a stop.		<p>Only axes resulting in a limit error come to a stop.</p>
	Error stop			<p>Only axes resulting in an error come to a stop.</p>

8.3 Electronic Gear Function

8.3.1 Outline of Electronic Gear Function

■ Electronic Gear Function

The electronic gear function operates the positioning unit at the speed of the master axis multiplied by a preset gear ratio.

■ Cautions for using the electronic gear function.

The use of the electronic gear function makes it possible to set the slave axes to a desired speed relative to the master axis. The movement amount of the slave axes, however, is obtained from the following formula. Therefore, the movement amount of the master axis does not coincide with that of the slave axes.

Movement amount of slave axes = Movement amount of master axis \times (gear ratio numerator/Gear ratio denominator)
 * On the condition that the gear ratios are constant.

Do not use the electronic gear function if the movement amount of the master axis needs to coincide with that of the slave axes.

◆ NOTE

Keep in mind that the slave axes may come to a sudden stop if an emergency stop or deceleration stop is executed while making a gear ratio change.

8.3.2 Types and Contents of Setting Parameters

The use of the electronic gear requires the following parameter settings.

Parameter name	Outline
Electronic gear operation settings	<p>Set to use or not to use the electronic gear function.</p> <p>The gear ratio of the electronic gear will be set to 1:1 if the electronic gear is not used, and the operation of the master axis will be input as it is into the electronic clutch.</p>
Gear ratio numerator	<p>Determines the gear ratio of the electronic gear.</p> <p>Electronic gear ratio is determined by the following formula.</p>
Gear ratio denominator	<p>Output speed of electronic gear = Operating speed of master axis x (Gear ratio numerator/Gear ratio denominator)</p>
Gear ratio change time	The time required to change the current gear ratio to a new gear ratio if the new gear ratio is set for the electronic gear in operation.

8.3.3 Gear Ratio Changes while in Operation

■ Precautions for gear ratio changes while the positioning unit is in operation

- If the gear ratio is changed with a new gear ratio while the electronic gear is in operation, the new gear ratio will be effective with an elapse of a preset gear change time.
- If the gear ratio change time is 1, the gear ratio will be changed at an acceleration/deceleration time of 0.
- Acceleration or deceleration during the gear ratio change results in linear acceleration or deceleration. S-shaped acceleration or deceleration cannot be used.

■ Programming

Follow the procedure below and write a user program in the case of changing the gear ratio while the positioning unit is in operation.

1. Change the gear ratio.

Change the gear ratio numerator and denominator of the electronic gear in the setting area for the electronic gear.

The gear ratio at the time of starting the positioning unit is set for this area. It is recommended to save the initial gear ratio before change so that the initial gear ratio can be reused with ease.

2. Turn ON the gear ratio change request contact.

Turn ON an I/O signal (electronic gear ratio change request) for the target axis allocated to the unit.

This signal enabled is of edge type. Starts the gear ratio change triggered by the gear ratio change request signal turned ON.

■ I/O allocation

Signal name	1st axis	2nd axis	3rd axis	4th axis
Slave axis gear ratio change request	Y90	Y91	Y92	Y93
Slave axis gear ratio change request	X90	X91	X92	X93

Turn OFF the gear ratio change request signal after changing the gear ratio.

◆ REFERENCE

For detailed information on the gear ratio setting area, refer to 17.7.1 Synchronous Control Setting Area.

8.4 Electronic Clutch Function

8.4.1 Electronic Clutch Function

The electronic clutch function is used to engage or disengage the clutch for output from the electronic gear. When the electronic clutch is disengaged, the master axis will be separated from the slave axes and the slave axes not in synchronization with the master axis will come to a stop. When the electronic clutch is engaged, the master axis and slave axes will operate in synchronization.

◆ **NOTE**

Keep in mind that the slave axes may come to a sudden stop if the clutch is disengaged while making a gear ratio change.

8.4.2 Types and Contents of Setting Parameters

The use of the electronic clutch requires the following parameter settings.

Parameter name	Outline
Electronic clutch used/unused	Set to use or not to use the electronic clutch function. The electronic clutch is by default disengaged. Be sure to engage the electronic clutch in response to the operation. The electronic clutch will be always engaged when the electronic clutch is not in use, in which case, output data from the electronic gear will be input as it is into the electronic cam. At that time, the master axis will always operate in synchronization with the slave axes.
Clutch ON	Trigger type
	Edge selection
	Method
	Slip time
Clutch OFF	Trigger type
	Edge selection
	Method
	Slip time

8.4.3 Trigger Types for Electronic Clutch

The following methods are available for the engagement or disengagement of the electronic clutch.

■ Clutch request signal (Y98 to Y9B and Y100 to Y103)

An I/O signal (clutch request signal) allocated to the unit is in control of the electronic clutch.

■ I/O allocation

Signal type	1st axis	2nd axis	3rd axis	4th axis	Operation
Slave axis clutch ON request	Y98	Y99	Y9A	Y9B	
Slave axis clutch OFF request	Y100	Y101	Y102	Y103	
Slave axis clutch operation annunciation	X98	X99	X9A	X9B	ON: Engaged; OFF: Disengaged

(Note): The above shows an example of the direct method selected for the engagement of the clutch.

■ Edge selection

Edge selection	Operation
Level	The clutch operation is switched by turning on or off the slave axis clutch ON request (Y98-Y9B). The slave axis clutch OFF request signal is not used. When the edge selection is level, the slave clutch OFF request (Y100-Y103) is invalid.
Leading edge	The clutch turns ON by the leading edge of the slave clutch ON request (Y98-Y9B). Also, the clutch turns OFF by the leading edge of the slave clutch OFF request (Y100-Y103).
Trailing edge	The clutch turns ON by the trailing edge of the slave clutch ON request (Y98-Y9B). Also, the clutch turns OFF by the trailing edge of the slave clutch OFF request (Y100-Y103).

8.4.4 Engagement Methods of Electronic Clutch

The electronic clutch function engages the clutch to start operating the slave axes and disengages the clutch to stop operating the slave axes, the acceleration or deceleration of the slave axes can be set as shown below.

■ Direct method

This method detects the engagement or disengagement of the clutch to adjust the operating speed of the master axis to coincide with that of the slave axes. In the direct method, the speed of the slave axes with the clutch engaged or disengaged coincides with the operating speed of the master axis with the acceleration and deceleration time set to 0.

■ Slip method

This method detects the engagement or disengagement of the clutch and set the slip time to acceleration time and deceleration time so that the operating speed of the slave axes to follow the operation speed of the master axis. Linear acceleration and deceleration will apply.

8.5 Electronic Cam Function

8.5.1 Outline of Electronic Cam Function

■ Electronic cam function

The electronic cam function uses a preset cam pattern, determines the movement amount of the slave axes according to the operation of the master axis (phase information) and cam pattern, and outputs the movement amount. The cam pattern uses one rotation of the master axis as an operation reference, based on which the displacement of the slave axes in each phase (rotation angle) is defined on the Configurator screen.

■ Cam pattern

The cam pattern uses one rotation of the master axis as an operation reference, based on which the displacement of the slave axes in each phase (rotation angle) is defined. The cam pattern is defined with the phase (rotation angle) of the master axis based on one rotation as a reference on the X-axis and the displacement on the Y-axis in percent. The cam pattern is set with the desired settings for the positioning unit selected from the FPWIN GR7 Configuration screen.

■ Cam pattern specifications

The following specifications of cam patterns can be set.

Setting items	Description
Resolution	1024, 2048, 4096, 8192, 16384, 32768
No. of cam patterns	Resolutions of 1024, 2048, 4096, and 8192: 16 Resolution of 16384: 8 Resolution of 32768: 4
Section setting	100%/cycle, 20 sections max.
Displacement setting	100% setting
Cam curve	Selected from the following ones Uniform velocity/Constant acceleration/Simple harmonic motion/Cycloid/Modified trapezoid/Modified sine/Trapecloid One-dwell cycloidal m=1/One-dwell cycloidal m=2/3/One-dwell modified trapezoid m=2/3/One-dwell modified trapezoidal (Ferguson)/One-dwell modified sine/One-dwell trapecloid/No-dwell modified trapezoid/NC2 curve/Asymmetric cycloid/Asymmetric modified trapezoid
Adjustment function	Function to adjust the displacement of desired point data. 1,000 points max. (in units of cam data)
Shift function	Phase shift in created cam data 0% to 100%
Indication	Displacement-Speed/Acceleration/Jerk A check box allows desired display.

8.5.2 Types and Contents of Setting Parameters

The use of the electronic cam requires the following parameter settings.

Parameter name	Outline
Electronic cam use/non-use	Select the use or non-use of the electronic cam function. When the electronic cam is not used, the electronic cam function will not work, and output from the electronic clutch will be output as pulses.
Cam pattern	The cam pattern is the most fundamental setting for using the electronic cam function. The cam pattern is set in the cam pattern settings window in the FPWIN GR7 Configuration screen. The positioning unit converts cam patterns into point data based on the preset cam curves and resolutions.
Cam control master axis period	Set the number of pulses corresponding to the total phase of the cam pattern used (one-rotation data on the master axis).
Cam pattern number to use	Specify the cam pattern number to be used from cam patterns created.
Cam stroke	Set the number of pulses corresponding to the total displacement (100%) of the cam pattern to use.

8.5.3 Cam Pattern Setting Method

■ Starting Cam Pattern Setting Screen

Open the Configuration screen on the FPWIN GR7 and select “Positioning settings” so that the setting tool for the positioning unit will start.

Select “Axis settings” - “Cam pattern settings” from the toolbar of the setting tool for the positioning unit or click the following icon:  The Cam Pattern Settings screen is displayed.

A blank screen will be displayed for a new file and settings for cam pattern 1 will be displayed if data already exists.

■ Resolution settings

Press the [Resolution] button on the Cam Pattern screen. The Resolution Settings screen will be displayed. Select the desired resolution and press the [OK] button.

◆ KEY POINTS

- The resolution is valid for all cam patterns. You cannot set a different resolution per cam pattern.
- The number of cam patterns available varies with each resolution. The current resolution cannot be changed to a new resolution if the number of cam patterns already set exceeds the number of cam patterns available for the new resolution. Delete the cam pattern and change the resolution.

■ Making/duplicating new cam pattern

The Cam No. Selection screen is displayed by pressing the [Add] button from the Cam field.

Select the desired cam number and press the [OK] button.

The cam pattern can be copied. Press the [Duplicate] button and select the copying destination and original cam pattern numbers.

To change the cam number, press the [Change] button and select the new cam number.

Note) The cam pattern number already set cannot be changed.

■ Making/duplicating new cam pattern

Set a cam pattern.

Press the [Insert] button from the Interval field. Select the desired starting phase and press the [OK] button.

The cam pattern is by default set to a single section at a phase of 0% to 100%.

The above section is divided into a number of sections by setting the starting phase.

The selected sections are displayed with a white background and the non-selected sections are displayed with a gray background.

◆ **NOTE**

In relation to the resolution, the starting phase may not be set to the specified phase value.

■ Editing of the cam table

Edit the cam table data that was created.

Set the following items for each section set:

- Starting phase (%)
- Displacement (%)
- Cam curve

The cam curve changes according to the settings.

◆ KEY POINTS

- The termination phase cannot be set. The termination phase will be changed automatically if the starting phase is changed.
- Do not make a radical displacement change of set cam curves. There is a possibility that the motor cannot keep up with the output in the case of rapid displacement.
- Similarly, make settings that a phase of 0% and that of 100% are the same in displacement.

■ Cam table checks

Check the cam table (cam curve) that has been set. The slave axes in synchronous control operate to follow the cam curve cam. Therefore, there will be a possibility that the motor cannot follow the output if the change in the cam curve is steep. In addition, it is important to know information on the acceleration as well as the displacement of the cam as factors affecting the change of the cam curve. The Cam Table Settings screen can display information on the following items besides the displacement.

Display item	Outline
Displacement	An item set on the cam table.
Speed	The operating speed of the cam table for the amount of displacement that has been set is displayed. The relative value is displayed.
Acceleration	The acceleration in each phase is displayed. Pay attention to points of significant acceleration changes, which involve radical speed changes.
Jerk	Jerk, which is obtained from acceleration differentiated by time, represents the rate of change of acceleration.

Each display item is set by checking the following boxes in the Cam Table Settings screen. Refer to each display item and make setting changes in the cam table.

■ Cam table adjustments

The Cam Table settings screen is provided with a function to make the fine-tuning of set cam curve data. In order to mitigate radical changes, this adjustment function makes it possible to fine-tune cam data that has been set. To make adjustments, select the target section number and press the [Adjust] button. The adjustment screen is displayed. The Adjustment screen displays the tables corresponding to the numbers of the designated sections out of all the sections (0% to 100%) divided by the resolution.

Select the data on the target phases (control points) and change the corresponding displacement data. The adjustments will be reflected by selecting [OK] and the set adjustment data will be cleared by selecting [Adjustment clear]. The numbers of the adjusted sections where the cam curve adjustments have been made are displayed in red, which tells that the adjustments have been completed.

Interval number	Start phase (%)	End phase (%)	Displacement (%)	Cam curve
1	0.0000000	39.9414063	50.0000000	Cycloid
2	39.9414063	60.0097656	-40.0000000	Modified sine
3	60.0097656	79.8828125	10.0000000	Trapezoid
4	79.8828125	0.0000000	0.0000000	One-dwell trapezoid

Adjusted data (displayed in red)

■ Cam table shift

The created cam pattern is defined with a phase of 0% to 100%, but the actual operation may differ in phase from the reference of the cam pattern. The cam table shift is a function to set the percentage of the created cam pattern for the phase at a current coordinate position of zero.

Shift image of electronic cam

Select the shift from "Interval" and set the shift amount.

The created cam pattern is shifted 10% and the display is updated.

Display example: The shift is set to 10%.

■ Cam table saving

The created cam table is saved automatically by pressing the [OK] button in the Cam Table Settings screen. Cam table stored is managed by FPWIN GR7 and set for the positioning unit when it is downloaded to the CPU module.

9

Manual Operation (JOG Operation)

9.1 Setting and Operation of JOG Operation

The example below is a case of the positioning unit installed in the slot 1. Settings are made in pulses.

■ Settings

Parameters required for the JOG operation of the positioning unit is set in the positioning setting menu of the programming tool.

Items	Setting example
Acceleration/deceleration pattern	0: Linear acceleration/deceleration
Acceleration time (ms)	100 ms
Deceleration time (ms)	100 ms
Target speed	10000 pps

■ Operation diagram

■ Operation of each contact

- The BUSY flag (X118), which indicates that the motor is running, will turn ON when the positioning control starts, and it will turn OFF when the operation completes.
- The operation done flag (X120), which indicates the completion of operation, will turn ON when the current operation is completed, and it will be held until the next positioning control, JOG operation, home return, or pulser operation starts.

■ Sample program

■ Programming Precautions

- The start contact and flag number varies depending on the number of axes and the installation position of the unit.
- The specified slot number varies depending on the installation position of the unit.

■ Operation at limit input

Condition	Direction	Limit status	Operation
When JOG operation is executed	Forward rotation	Limit input (+):ON	Not executable, Error occurs.
		Limit input (-):ON	Executable
	Reverse rotation	Limit input (+):ON	Executable
		Limit input (-):ON	Not executable, Error occurs.
During JOG operation	Forward rotation	Limit input (+):ON	Deceleration stop, Error occurs.
	Reverse rotation	Limit input (-):ON	Deceleration stop, Error occurs.

9.2 Changing the Speed During JOG Operation

The target speed can be changed while the positioning unit is in JOG operation.

■ Settings

Parameters required for the JOG operation of the positioning unit is set in the positioning setting menu of the programming tool.

Items	Setting example	
Acceleration/deceleration pattern	0: Linear acceleration/deceleration	
Acceleration time 1 (ms)	100 ms	
Deceleration time 1 (ms)	50 ms	
Target speed 1	10000 pps	
Acceleration time 2 (ms)	200 ms	The set values of acceleration time, deceleration time, and target speed after the speed change are written to the unit memory by the program.
Deceleration time 2 (ms)	150 ms	
Target speed 2	20000 pps	

■ Operation diagram

■ Operation of each contact

- The BUSY flag (X118), which indicates that the motor is running, will turn ON when the JOG operation starts, and it will turn OFF when the operation completes.
- The target speed can be changed freely while the positioning unit is in JOG operation. Use a program to change the target speed.
- The operation done flag (X120), which indicates the completion of operation, will turn ON when the current operation is completed, and it will be held until the next positioning control, JOG operation, home return, or pulser operation starts.

■ Sample program

■ Programming Precautions

- To change the JOG operation speed, use a user program and rewrite the unit memory (UM0082A to UM0082C).
- The start contact and flag number varies depending on the number of axes and the installation position of the unit.
- The specified slot number varies depending on the installation position of the unit.

Manual Operation (JOG Operation)

10

Manual Operation (Home Return)

10.1 Pattern of Home Return

The home return is a function to move the current position to the reference origin and set the coordinates as 0.

The following home return methods are available for the positioning unit.

■ DOG method 1 (Edge detection of near home switch + First rising edge of home position as reference)

The first rising edge of home position switch is detected after detecting the rising edge of the near home switch. It becomes the start point.

Note) When the home sensor is ON at startup, the operation is similar to ②.

■ DOG method 2 (Edge detection of near home switch)

The rising edge of the near home switch is detected. It becomes the start point.

■ **DOG method 3 (Edge detection of near home switch + Falling edge of home position as reference)**

The falling edge of the near home switch is detected. The first rising edge of the home switch in the home return direction becomes the start point.

Note) When the home sensor is ON at startup, the operation is similar to ③.

■ **Limit method 1 (Edge detection of limit switch + First rising edge of home position as reference)**

Reverses after detecting the rising edge of the limit switch on the opposite side of the home return direction. The first rising edge of the home switch is detected. It becomes the start point.

Note) When the home sensor is ON at startup, the operation is similar to ①.

Manual Operation (Home Return)

■ Limit method 2 (Edge detection of limit switch)

Detects the rising edge of the limit switch in the home return direction and stops. That point becomes the start point.

■ Home position method (Edge detection of home switch)

Moves from the current position in the home return direction, and detects the first rising edge of the home switch and stops. That point becomes the start point.

Note) When the home sensor is ON at startup, the unit does not detect the home sensor and operates to the home return direction.

■ Data set method

The current value is considered as the origin.

10.2 Setting and Operation of Home Return

The example below is a case of the positioning unit installed in the slot 1. Settings are made in pulses.

■ Settings

Parameters required for the home return operation of the positioning unit is set in the positioning setting menu of the programming tool.

Items	Setting example
Return setting code	0: DOG method 1
Return direction	0: Limit (-) direction
Acceleration time (ms)	100 ms
Deceleration time (ms)	100 ms
Target speed	10000 pps
Return creep speed	1000 pps
Deviation counter clear signal ON time	1 ms

■ Operation diagram

Manual Operation (Home Return)

■ Operation of each contact

- The BUSY flag (X118) indicating the state that a motor is running will turn ON when the home return of the positioning unit starts, and it will turn OFF when the operation completes.
- The deviation counter clear signal will turn ON during the ON time of the deviation counter clear signal on completion of the home return.
- The home return done flag (X128) indicating the state of operation completion will turn ON when the home return operation is completed, and it will be held until the next positioning control, JOG operation, home return, or pulser operation starts. The timing of that the flag turns ON is at the time that the home return operation is completed.

■ Sample program

■ Programming Precautions

- The start contact and flag number varies depending on the number of axes and the installation position of the unit.
- The specified slot number varies depending on the installation position of the unit.

■ Operation at limit input

Condition	Direction	Limit status	Operation
When Home return operation is executed	Forward rotation	Limit input (+):ON	Executable
		Limit input (-):ON	Executable
	Reverse rotation	Limit input (+):ON	Executable
		Limit input (-):ON	Executable
During Home return operation	Forward rotation	Limit input (+):ON	Automatic reverse operation
	Reverse rotation	Limit input (-):ON	Automatic reverse operation

11

Manual Operation (Pulser Operation)

11.1 Setting and Operation of Pulser Operation

■ Types of Pulser Operation

Pulser operation is a function that uses a pulser connected to the positioning unit to output pulses manually.

The following pulser operation methods are available.

Operation method	Operation
Standard operation	Obtains the number of pulser pulses in 1-ms units and operates. Reflects the content of pulse input directly in the actual operation of the positioning unit.
Speed limits (pulses hold)	When the speed of pulse input exceeds the preset maximum speed, the operation will continue with the maximum speed maintained. The number of pulser pulses input will be maintained. Therefore, pulses not output will be maintained. Therefore, pulses may be output even if there is no pulser input. Speed unit is "Set unit x 1000/s".
Speed limits (Truncate)	When the speed of pulse input exceeds the preset maximum speed, the operation will continue with the maximum speed maintained. Pulses are output in synchronization with the operation of the pulser while pulses not output are discarded. Speed unit is "Set unit x 1000/s".

The example below is a case of the positioning unit installed in the slot 1. Settings are made in pulses.

■ Settings

Parameters required for the pulser operation of the positioning unit is set in the positioning setting menu of the programming tool.

Items	Setting example	Settable range
Operation setting code	0: Pulser 1 1: Pulser 2 2: Pulser 3 3: Pulser 4	0: Pulser 1 1: Pulser 2 2: Pulser 3 3: Pulser 4
Pulser operation ratio numerator	2	1 to 32,767
Pulser operation ratio denominator	1	1 to 32,767
Pulser operation method	2: Speed limits (truncated)	0: Standard operation 1: Speed limits (pulse hold) 2: Speed limits (truncated)
Pulser operation max. speed	500	Pulse: 1 to 32,767,000 pps

■ Operation diagram

■ Operation of each contact

- The BUSY flag (X118) indicating the state that a motor is running will turn ON when the pulser operation permit contact turns ON and will turn OFF when the contact turns OFF.
- The operation done flag (X120) indicating the state of operation completion will turn ON when the pulser operation permit contact is turned OFF and the flag will be maintained until the next positioning control, JOG operation, home return, or pulser operation starts.

Manual Operation (Pulser Operation)

■ Sample program

■ Programming Precautions

- The movement amount per an 1-pulse signal from the pulser can be changed by setting the ratio numerator and ratio denominator for the input signal of the pulser.
- The start contact and flag number varies depending on the number of axes and the installation position of the unit.
- The specified slot number varies depending on the installation position of the unit.

■ Operation at limit input

Condition	Direction	Limit status	Operation
When Pulser operation is executed	Forward rotation	Limit input (+):ON	Not executable, Error occurs.
		Limit input (-):ON	Executable
	Reverse rotation	Limit input (+):ON	Executable
		Limit input (-):ON	Not executable, Error occurs.
During Pulser operation	Forward rotation	Limit input (+):ON	Deceleration stop, Error occurs.
	Reverse rotation	Limit input (-):ON	Deceleration stop, Error occurs.

12

Stop Functions

12.1 Settings and Operations of Stop Functions

Following stop functions are available during operations. Each deceleration time can be set individually. Set the deceleration time according to each occurrence condition of the stop operation.

Name	Occurrence condition	Stop axis	Stop
Deceleration stop	Deceleration stop contact turns ON	Each axis	Stops control with an elapse of deceleration time.
Pause	Deceleration stop contact turns ON	Each axis	Stops control with an elapse of deceleration time, and resume control upon cancellation of the deceleration stop.
Emergency stop	Emergency stop contact turns ON	Each axis	Stops with an elapse of emergency stop deceleration time.
Limit stop	Limit switch input turns ON	Each axis	Stops with an elapse of limit stop deceleration time.
Software limit stop	When exceeding the range of the software limit	Each axis	
Error stop	An error occurs	Each axis	Stops with an elapse of error stop deceleration time.
System stop	System stop contact turns ON	All axes	All axes stop without deceleration time.

The deceleration stop, pause, emergency stop, and system stop will be enabled when the respective request contacts in the I/O area turn ON. The stop state will be enabled while each contact is ON and maintained until each request signal is turned OFF. No operation is possible while the positioning unit is in the stop state.

Refer to the following table for the stop by turning contacts ON. It indicates the allocated I/O when the positioning unit is installed in the slot 1.

Contact allocation	Target axis	Name	Description
Y100	All axes	System stop	Contact for requesting the system stop. When it turns ON, all axes will stop at the deceleration time 0.
Y130	1st axis	Emergency stop	Requests the emergency stop of the corresponding axis.
Y131	2nd axis		The deceleration time for the emergency stop is set in the emergency stop deceleration time area in the unit memory.
Y132	3rd axis		(The operation is of level type.)
Y133	4th axis		Note) The deviation counter cannot be cleared.
Y137	Virtual axis		
Y138	1st axis	Deceleration stop	Requests the deceleration stop of the corresponding axis.
Y139	2nd axis		The deceleration stop time becomes the deceleration time of the positioning unit in operation.
Y13A	3rd axis		(The operation is of level type.)
Y13B	4th axis		Note) The deviation counter cannot be cleared.
Y13F	Virtual axis		

12.2 Settings and Operations of Pause Functions

The pause function temporarily stops operation. Toggle between the pause function and the deceleration stop function for use.

The pause function performs a deceleration stop in the deceleration time of operation when the deceleration stop request contact turns ON. After that, the stop state will be maintained while the deceleration stop request contact is ON, and the control stopped will restart when the deceleration stop request contact turns OFF.

Toggle between the pause function and deceleration stop function in the system operation setting area in the unit memory.

System operation setting area

Unit memory no. (Hex)	Name	Description
UM 00389	Deceleration stop operation	<p>Specify the operation of the positioning unit with the deceleration stop request signal activated (turned ON).</p> <p>0: Deceleration stop</p> <p>While the positioning unit is in repetitive control, the positioning unit will come to a stop after the position moves to E point of the repetitive target.</p> <p>1: Pause</p> <ul style="list-style-type: none"> Performs a deceleration stop, and positioning will restart when the deceleration stop request signal is canceled (turned OFF). The positioning unit will perform the same operation as a deceleration stop unless the positioning unit is in positioning operation. While the positioning unit is in repetitive operation, the positioning unit will come to a stop after the position moves to the E point of the repetitive target, and repetitive control will restart when the deceleration stop request signal is canceled (turned OFF). If a system stop or emergency stop is executed while the positioning unit is paused, the pause state will be canceled and the operation will not restart with the deceleration stop request signal is canceled (turned OFF). <p>Default: 0</p>

NOTES

- No deceleration stop can be executed while the pause function is in use. Use the emergency stop function in the case of executing a stop while the pause function is in use.**
- The pause function is enabled only when the positioning unit is in automatic operation (positioning control). There will be no difference in operation from a deceleration stop while the positioning unit is in manual operation.**

- Like other stop functions, the pause function will maintain the stop state while the deceleration stop (pause) request signal is ON. The pause will be canceled if an emergency stop or system stop is executed while the positioning unit is not operating, and the positioning unit will go into the emergency stop or system stop state.
- Switch the operation of the pause function by rewriting the value in the above unit memory address.

13

Supplementary Functions

13.1 Dwell Time

The time taken until the next operation after the completion of an executed positioning table in the automatic operation is called dwell time.

■ For E-point control

The dwell time is the time taken from the completion of the position reference until the operation done flag turns ON.

■ For P-point control

While the positioning unit is in P-point control, the positioning table will operate consecutively, and the dwell time will be ignored. For the last table (E point), like E-point control, dwell time is a period required from the completion of the position reference until the operation done flag turns ON.

■ For C-point control

The dwell time is the waiting time for executing the next table from the completion of the positioning table (deceleration stop). For the last table (E point), like E-point control, dwell time is a period required from the completion of the position reference until the operation done flag turns ON.

13.2 Software Limit

The system is designed to mechanically set the limit (+) and limit (-) to restrict the moving range of a motor.

Separately from the mechanical limits (+) and (-), the software limit is a function to add the limits for the absolute coordinate managed within the positioning unit. As the software limit is a function for the protection of the motor and AMP, it is recommended to set them to the values within the range of the mechanical limits (+) and (-) as below.

If the operating range of the motor exceeds the setting range of the software limit (upper and lower limit values), an error will occur, and the deceleration stop will be executed. It is necessary to clear the error and move the motor into the range of the software limit using an operation such as JOG operation after the stop.

Whether the software limit enabled or disabled can be specified individually for the positioning control, JOG operation, and home return operation. For example, it is possible to disable the limit software only in home return operation.

13.3 Auxiliary Output Code and Auxiliary Output Contact

The auxiliary output contact is a function to announce externally which table is in operation when the automatic operation (E-point control, C-point control, P-point control, and J-point control) is executed.

The auxiliary output contact and auxiliary output code are available by setting parameter auxiliary output to With mode or Delay mode on an axis-by-axis basis.

■ Auxiliary output contact

The auxiliary output contact operates either in With mode or Delay mode.

Auxiliary output mode	Operation
With mode	When the automatic operation starts, the auxiliary contact flag of the corresponding axis allocated to I/O will turn ON.
Delay mode	<p>The auxiliary contact flags for corresponding axes allocated to the I/O area will turn ON according to the ratio of positioning movement (%) while the positioning unit is in automatic operation.</p> <p>The turn ON ratio while the positioning unit is in Delay mode is set in the Delay ratio area of auxiliary output in the unit memory.</p> <p>There will be no difference between the With mode and Delay mode in operation if J-point control is set for the automatic operation of the positioning unit.</p>

The ON time of the auxiliary contact flag can be specified in ms increments.

◆ NOTE

There will be no difference between the Delay mode and With mode in operation while the positioning unit is in J-point control.

■ Auxiliary output data

The auxiliary output data (1 word) can be set for each table of the positioning data. The content of the process currently carried out can be confirmed by setting auxiliary output.

The values in the auxiliary output data are held until the next positioning table is executed. The auxiliary output data that was output just before the completion of the automatic operation is held.

◆ NOTE

Auxiliary output data will maintain the value regardless of the type of auxiliary output mode (the with mode or delay mode) until the next positioning table is executed.

13.4 Current Value Update

The current value update function is a function to change the current value controlled by the positioning unit to a desired (preset) value.

Refreshing the current value requires data writing to the unit memory.

■ Current value update area (Unit memory)

Unit memory no. (Hex)	Name	Description																																											
UM 000C0	Current value update request flag	<p>Only when the corresponding bit for each axis changes to 1 from 0, the current coordinate controlled by the positioning unit to the following current value.</p> <p>After the change, the positioning unit will clear the corresponding bits to 0 automatically.</p> <table border="1"> <thead> <tr> <th>bit</th><th>Name</th><th>Default</th><th>Description</th></tr> </thead> <tbody> <tr> <td>0</td><td>Current value update request for 1st axis</td><td>0</td><td>0: No change 1: Changes the corresponding coordinate origin. (After change, the positioning unit clears the corresponding bits to 0 automatically.)</td></tr> <tr> <td>1</td><td>Current value update request for 2nd axis</td><td>0</td><td></td></tr> <tr> <td>2</td><td>Current value update request for 3rd axis</td><td>0</td><td></td></tr> <tr> <td>3</td><td>Current value update request for 4th axis</td><td>0</td><td></td></tr> <tr> <td>4</td><td>—</td><td>—</td><td></td></tr> <tr> <td>5</td><td>—</td><td>—</td><td></td></tr> <tr> <td>6</td><td>—</td><td>—</td><td></td></tr> <tr> <td>7</td><td>Current value update request for virtual axis</td><td>0</td><td></td></tr> <tr> <td>15 to 8</td><td>—</td><td>—</td><td>—</td></tr> </tbody> </table>				bit	Name	Default	Description	0	Current value update request for 1st axis	0	0: No change 1: Changes the corresponding coordinate origin. (After change, the positioning unit clears the corresponding bits to 0 automatically.)	1	Current value update request for 2nd axis	0		2	Current value update request for 3rd axis	0		3	Current value update request for 4th axis	0		4	—	—		5	—	—		6	—	—		7	Current value update request for virtual axis	0		15 to 8	—	—	—
bit	Name	Default	Description																																										
0	Current value update request for 1st axis	0	0: No change 1: Changes the corresponding coordinate origin. (After change, the positioning unit clears the corresponding bits to 0 automatically.)																																										
1	Current value update request for 2nd axis	0																																											
2	Current value update request for 3rd axis	0																																											
3	Current value update request for 4th axis	0																																											
4	—	—																																											
5	—	—																																											
6	—	—																																											
7	Current value update request for virtual axis	0																																											
15 to 8	—	—	—																																										
UM 000C8	Current value update coordinate of 1st axis	Stores the coordinate to be preset as the current value of 1st axis.																																											
UM 000C9	Current value update coordinate of 2nd axis	Stores the coordinate to be preset as the current value of 2nd axis.																																											
UM 000CA	Current value update coordinate of 3rd axis	Stores the coordinate to be preset as the current value of 3rd axis.																																											
UM 000CB	Current value update coordinate of 4th axis	Stores the coordinate to be preset as the current value of 4th axis.																																											
UM 000CC	Current value update coordinate of virtual axis	Stores the coordinate to be preset as the current value of virtual axis..																																											
UM 000CD																																													
UM 000CE																																													
UM 000CF																																													
UM 000D6																																													
UM 000D7																																													

■ Current value update procedure

1. Write a coordinate to be preset in the current value update coordinate area of the axis to update the current value.
2. Preset the target axis bit to 1 in the current value update request flag area. As the current value update process is performed for the axis that is 1 in the current value request flag area, do not set any bit to 1 other than the target axis.
3. The current value after unit conversion in each axis information and monitor area is changed to the specified current value.

◆ **NOTE**

The value to be changed by updating the current value is the current value after unit conversion.

13.5 Coordinate Origin

The positioning unit performs a home return to set the managing coordinate to 0.

The coordinate origin is a function that allows to set the coordinate to a desired value after home return processing.

■ Coordinate origin processing procedure

1. Write a coordinate to be the home in the home coordinate area of the target axis for which the coordinate is to be changed after a home return.
2. Execute the home return process. After the completion of the home return, the coordinate specified in the above 1 will become the home position.

Unit memory no. (Hex)	Name	Default	Setting range and description
UM 0084A UM 0084B	Coordinate origin of 1st axis		
UM 0304A UM 0304B	Coordinate origin of 2nd axis		
UM 0584A UM 0584B	Coordinate origin of 3rd axis	-	Stores the value of coordinate origin after the home return.
UM 0804A UM 0804B	Coordinate origin of 4th axis		
UM 1204A UM 1204B	Coordinate origin of virtual axis		

◆ NOTE

Set the coordinate origin in the specified unit.

13.6 Pulse Input

13.6.1 Pulse Input Types

Each axis of the positioning unit has pulse input, thus connecting to a variety of input devices. Select the desired type of pulse input in the positioning setting menu of the tool software.

■ Purpose of pulse input

Input target	Description
Pulser	<ul style="list-style-type: none"> Select this to use manual pulsers. The use of a pulser operation setting code allows to specify the target axis (ch) where the pulser will be used.
Feedback pulse	<p>Set feedback pulse input in the case of connecting an encoder in order to monitor the rotation of the motor.</p> <ul style="list-style-type: none"> When feedback pulse input is selected, the positioning unit uses pulse input to perform the feedback pulse count of its own axis, thus detecting the difference between the instruction value and pulse input value. (Automatic check function of movement amount)
High-speed counter	<ul style="list-style-type: none"> Set high-speed counter input to be used as general-purpose counter input. High-speed counter input supports a variety of input types (i.e., two-phase input, direction discrimination input, and individual input). The positioning unit stores the number of input pulses in the monitor area.

13.6.2 Restrictions on Combinations of Pulse Inputs

■ Restrictions on combinations of pulse inputs

			Pulse input purpose		
			Pulsar	Feedback pulse	High-speed counter
Pulse input mode parameter	Rotation direction	Forward	Available	Available	Available
	Reverse	Available	Available	Available	Available
	Input mode	2-phase input	Available	Available	Available
		Direction discrimination input	Not available	Not available	Available
		Individual input	Not available	Not available	Available
	Multiple	1 multiple	Not available	Available	Available
		2 multiple	Not available	Available	Available
		4 multiple	Available	Available	Available
	Pulse input	Enable	Available	Available	Available
		Disable	Not available	Not available	Available
	Pulse count value	Clear	Not available	Available	Not available
		Set	Not available	Available	Available

13.6.3 Input Mode to Pulse Input

- Select from the following three types according to input devices to be connected.
- The count operation varies depending on the settings of multiplication factor as shown on the next page.

■ Input method to pulse input

Method	Connection	Count
2-phase (Phase difference)		<p>For the 2-phase input, the input A signal and input B signal of each counter are connected to the phase A and phase B of an encoder.</p> <p>The count direction depends on the phase difference between phases A and B. When the phase A is proceeding by 90 degrees in electrical angle than the phase B, the count value is incremented. When the phase A is delayed by 90 degrees in electrical angle than the phase B, the count value is decremented.</p>
Individual		<p>In the individual input method, the counter is incremented when the input A signal rises or falls, and decremented when the input B signal rises or falls.</p>
Direction discrimination		<p>For the direction detection input, the count signal is connected to the input A signal. The count direction is controlled by the level of the direction signal of input B signal.</p> <p>When the input B signal is on, the counter is incremented when the input A signal rises or falls. When the input B signal is off, the counter is decremented.</p>

Supplementary Functions

■ Count operation of 2-phase input (Phase difference input)

Multiple	Time chart	
	Addition	Subtraction
1 multiple	<p>Input A ON OFF</p> 	
2 multiple	<p>Input A ON OFF</p> 	
4 multiple	<p>Input A ON OFF</p> 	

■ Count operation of individual input

Multiple	Time chart	
	Addition	Subtraction
1 multiple	<p>Input A ON OFF</p> 	
2 multiple	<p>Input A ON OFF</p> 	

■ Count operation of direction discrimination input

Multiple	Time chart	
	Addition	Subtraction
1 multiple	<p>Input A ON OFF</p> 	
2 multiple	<p>Input A ON OFF</p> 	

13.6.4 Monitoring Pulse Input Values

The positioning unit can monitor pulse input from programs.

Pulse input monitoring uses the following areas.

Unit memory no. (Hex)	Name	Description
UM 00436	Pulse input value of 1st axis	Pulse input values are stored according to the pulse input application (e.g., pulser, feedback pulse, or high-speed counter). (Unit: pulse)
UM 00437		
UM 00476	Pulse input value of 2nd axis	Pulse input values are integrated and stored, and will be cleared if the pulse input application is changed or when the pulse input values are cleared.
UM 00477		
UM 004B6	Pulse input value of 3rd axis	
UM 004B7		
UM 004F6	Pulse input value of 4th axis	
UM 004F7		

13.6.5 Pulser Input Function

By setting the positioning unit to pulser for the pulse input application, a manual pulser can be used.

Settings allow manual pulsers to connect to different axes. Therefore, a single pulser can operate a number of axes simultaneously. However, pay attention to settings for the axis connected to the pulser and the axes operated by the pulser.

Refer to the following table and make settings for the pulse input application.

Settings for pulse input application		Pulser operation	
Pulser connecting axis	Pulser operating axis	Operation	Outline
Feedback pulse	Feedback pulse		The positioning unit does not recognize pulse input as the manual pulser, thus not allowing the operation of the pulser.
High-speed counter	High-speed counter Pulser	No	
Pulser	Feedback pulse	Yes	The pulser operates. The feedback pulse function is available while the pulser is in operation.
	High-speed counter	Yes	The pulser operates. The high-speed counter function is available while the pulser is in operation.
	Pulser	Yes	The pulser operates.

13.6.6 Feedback Pulse Function

By setting the pulse input application to feedback pulse, the positioning unit can use the function to utilize feedback pulses from the encoder.

■ Automatic check function of movement amount

The automatic check function of movement amount is used to check whether each axis in operation is operating according to the instruction value, and the function compares the difference between the current value (absolute) under the internal control of the unit and the feedback pulse input (deviation) with a threshold preset. The automatic check function of movement amount works for all types of operation.

The automatic check function of movement amount will work only if the pulse input application is set to feedback pulse, and will not work if it is set to pulser or high-speed counter. The automatic check function of movement amount will be disabled if the synchronous control function is used.

The automatic check function of movement amount is set in the following areas.

1st axis

Unit memory no. (Hex)	Name	Description
UM 00808	Numerator of automatic movement amount check correction	Set a correction value of pulse input at the time of making an automatic movement amount check.
UM 00809	Denominator of automatic movement amount check correction	The following formula is used to calculate a deviation feedback value (pulse input value with a correction) from pulse input and make an automatic movement amount check. $\text{Deviation feedback value} = (\text{Correction numerator}/\text{Correction denominator}) \times \text{Pulse input}$
UM 0080A	Automatic movement amount checking	Set an action when the difference between the instruction value and feedback value exceeds the movement check value at the time of automatic movement amount check. 0: Error An error will occur and the operation of the positioning unit will come to a stop if the difference between the feedback value and reference movement exceeds the movement check value (threshold). The pulse input will be cleared when the error is cleared. 1: Warning A warning will occur and the operation of the positioning unit will come to a stop if the difference between the feedback value and reference movement exceeds the movement check value (threshold). The pulse input will be cleared when the warning is cleared. 2: No No movement check is made.
UM 00818	Automatic movement amount check value	Set the threshold to use the automatic check function of movement amount.
UM 0081A	Automatic movement amount check interval	Set the interval of automatic movement amount checking (Unit: ms)

2nd axis

Unit memory no. (Hex)	Name	Description
UM 03008	Numerator of automatic movement amount check correction	Refer to the description for the 1st axis.
UM 03009	Denominator of automatic movement amount check correction	
UM 0300A	Automatic movement amount checking	
UM 03018	Automatic movement amount check value	
UM 0301A	Automatic movement amount check interval	

Supplementary Functions

3rd axis

Unit memory no. (Hex)	Name	Description
UM 05808	Numerator of automatic movement amount check correction	Refer to the description for the 1st axis.
UM 05809	Denominator of automatic movement amount check correction	
UM 0580A	Automatic movement amount checking	
UM 05818	Automatic movement amount check value	
UM 0181A	Automatic movement amount check interval	

4th axis

Unit memory no. (Hex)	Name	Description
UM 08008	Numerator of automatic movement amount check correction	Refer to the description for the 1st axis.
UM 08009	Denominator of automatic movement amount check correction	
UM 0800A	Automatic movement amount checking	
UM 08018	Automatic movement amount check value	
UM 0801A	Automatic movement amount check interval	

■ Operation of automatic check function of movement amount

The automatic check function of movement amount operates in the following procedure while the positioning unit is in operation.

1. The current position of the positioning unit will be saved in the unit the moment the positioning unit starts operating.
2. After the positioning unit starts operating, the automatic check function of movement amount will come to a stop until the automatic movement check interval elapses.
3. After the movement amount automatic interval elapses, the deviation feedback value calculated from the current pulse input value will be compared with the saved pulse input value, and the difference (deviation) will be checked whether it is in excess of the value set for the automatic movement check value.
4. The current position of the positioning unit will be saved in the unit.
5. Steps 2 to 4 above will be repeated.

◆ NOTE

Set the automatic movement check interval with consideration of the response time of the encoder in use.

■ Deviation monitoring

The value (deviation) calculated by the automatic check function of movement amount can be checked with the program.

The deviation monitor uses the following areas.

Unit memory no. (Hex)	Name	Description
UM 00434	Deviation of 1st axis	
UM 00435		
UM 00474	Deviation of 2nd axis	
UM 00475		
UM 004B4	Deviation of 3rd axis	
UM 004B5		
UM 004F4	Deviation of 4th axis	
UM 004F5		

The maximum value of the deviation (the difference between the pulse input value and instruction value) will be stored.

■ Clearing pulse input value

Pulses input as feedback pulses are integrated and stored as a pulse input value.

The pulse input value will be cleared at completion of home return when feedback pulses are used for the pulse input application.

Supplementary Functions

■ Changing pulse input value

If the pulse input application is set to feedback pulse, the pulse input value can be changed to a desired value.

The following areas are used to change the pulse input value.

Unit memory no. (Hex)	Name	Description																											
UM 00241	Pulse count value change request flag	<p>The pulse input value will be changed to the set pulse count when the corresponding bit for each axis is set to 1 from 0.</p> <p>This flag is an edge trigger. Be sure to change the flag to 1 from 0 at the time of the change. After the change, the positioning unit will clear the corresponding bits to 0 automatically.</p> <table border="1"><thead><tr><th>bit</th><th>Name</th><th>Default</th><th>Description</th></tr></thead><tbody><tr><td>0</td><td>Pulse count change of 1st axis</td><td>0</td><td>0: The pulse input value is not changed.</td></tr><tr><td>1</td><td>Pulse count change of 2nd axis</td><td>0</td><td>0→1: Pulse input value change</td></tr><tr><td>2</td><td>Pulse count change of 3rd axis</td><td>0</td><td></td></tr><tr><td>3</td><td>Pulse count change of 4th axis</td><td>0</td><td></td></tr><tr><td>15 to 4</td><td>–</td><td>–</td><td>–</td></tr></tbody></table>				bit	Name	Default	Description	0	Pulse count change of 1st axis	0	0: The pulse input value is not changed.	1	Pulse count change of 2nd axis	0	0→1: Pulse input value change	2	Pulse count change of 3rd axis	0		3	Pulse count change of 4th axis	0		15 to 4	–	–	–
bit	Name	Default	Description																										
0	Pulse count change of 1st axis	0	0: The pulse input value is not changed.																										
1	Pulse count change of 2nd axis	0	0→1: Pulse input value change																										
2	Pulse count change of 3rd axis	0																											
3	Pulse count change of 4th axis	0																											
15 to 4	–	–	–																										
UM 00248	Pulse input value change of 1st axis	Set the desired pulse input value for the 1st axis.																											
UM 00249	Pulse input value change of 2nd axis	Set the desired pulse input value for the 2nd axis.																											
UM 0024A	Pulse input value change of 3rd axis	Set the desired pulse input value for the 3rd axis.																											
UM 0024B	Pulse input value change of 4th axis	Set the desired pulse input value for the 4th axis.																											
UM 0024C	Pulse input value change of 1st axis	Set the desired pulse input value for the 1st axis.																											
UM 0024D	Pulse input value change of 2nd axis	Set the desired pulse input value for the 2nd axis.																											
UM 0024E	Pulse input value change of 3rd axis	Set the desired pulse input value for the 3rd axis.																											
UM 0024F	Pulse input value change of 4th axis	Set the desired pulse input value for the 4th axis.																											

13.6.7 High-speed Counter Function

By setting the positioning unit to high-speed counter for the pulse input application, pulse input can be used as an external counter.

■ Controlling pulse input

By setting the positioning unit to high-speed counter for the pulse input application, the pulse input count can be stopped as desired. The current pulse input value will be kept on hold when the pulse input count is stopped.

The pulse input count is enabled or disabled with settings in the following areas.

Unit memory no. (Hex)	Name	Description																											
UM 00240	Pulse count enable flag	<p>The pulse input value will be changed to the set pulse count when the corresponding bit for each axis is set to 0 from 1.</p> <table border="1"><thead><tr><th>bit</th><th>Name</th><th>Default</th><th>Description</th></tr></thead><tbody><tr><td>0</td><td>1st axis pulse count enabled</td><td>0</td><td>0: Pulse count enabled</td></tr><tr><td>1</td><td>2nd axis pulse count enabled</td><td>0</td><td>1: Pulse count disabled</td></tr><tr><td>2</td><td>3rd axis pulse count enabled</td><td>0</td><td></td></tr><tr><td>3</td><td>4th axis pulse count enabled</td><td>0</td><td></td></tr><tr><td>15 to 4</td><td>–</td><td>–</td><td>–</td></tr></tbody></table>				bit	Name	Default	Description	0	1st axis pulse count enabled	0	0: Pulse count enabled	1	2nd axis pulse count enabled	0	1: Pulse count disabled	2	3rd axis pulse count enabled	0		3	4th axis pulse count enabled	0		15 to 4	–	–	–
bit	Name	Default	Description																										
0	1st axis pulse count enabled	0	0: Pulse count enabled																										
1	2nd axis pulse count enabled	0	1: Pulse count disabled																										
2	3rd axis pulse count enabled	0																											
3	4th axis pulse count enabled	0																											
15 to 4	–	–	–																										

■ Changing pulse input value

If the pulse input application is set to high-speed counter, the pulse input value can be changed to a desired value.

The following areas are used to change the pulse input value.

Unit memory no. (Hex)	Name	Description																											
UM 00241	Pulse count value change request flag	<p>The pulse input value will be changed to the set pulse count when the corresponding bit for each axis is set to 1 from 0.</p> <p>This flag is an edge trigger. Be sure to change the flag to 1 from 0 at the time of the change. After the change, the positioning unit will clear the corresponding bits to 0 automatically.</p> <table border="1"> <thead> <tr> <th>bit</th><th>Name</th><th>Default</th><th>Description</th></tr> </thead> <tbody> <tr> <td>0</td><td>Pulse count change of 1st axis</td><td>0</td><td>0: Pulse input value not changed.</td></tr> <tr> <td>1</td><td>Pulse count change of 2nd axis</td><td>0</td><td>0→1: Pulse input value change</td></tr> <tr> <td>2</td><td>Pulse count change of 3rd axis</td><td>0</td><td></td></tr> <tr> <td>3</td><td>Pulse count change of 4th axis</td><td>0</td><td></td></tr> <tr> <td>15 to 4</td><td>–</td><td>–</td><td>–</td></tr> </tbody> </table>				bit	Name	Default	Description	0	Pulse count change of 1st axis	0	0: Pulse input value not changed.	1	Pulse count change of 2nd axis	0	0→1: Pulse input value change	2	Pulse count change of 3rd axis	0		3	Pulse count change of 4th axis	0		15 to 4	–	–	–
bit	Name	Default	Description																										
0	Pulse count change of 1st axis	0	0: Pulse input value not changed.																										
1	Pulse count change of 2nd axis	0	0→1: Pulse input value change																										
2	Pulse count change of 3rd axis	0																											
3	Pulse count change of 4th axis	0																											
15 to 4	–	–	–																										
UM 00248	Pulse input value change of 1st axis	Set the desired pulse input value for the 1st axis.																											
UM 00249																													
UM 0024A	Pulse input value change of 2nd axis	Set the desired pulse input value for the 2nd axis.																											
UM 0024B																													
UM 0024C	Pulse input value change of 3rd axis	Set the desired pulse input value for the 3rd axis.																											
UM 0024D																													
UM 0024E	Pulse input value change of 4th axis	Set the desired pulse input value for the 4th axis.																											
UM 0024F																													

13.7 Startup speed

The positioning unit allows startup speed settings for the startup of each type of operation. The startup speed is available for positioning, JOG operation, and home return control.

■ Setting method of startup speed

Set the startup speed in the parameter-setting menu for each axis of the Configurator PM7.

■ Cautions for start speed settings

1. The startup speed will apply to the end of operation as well. The speed at the end of operation cannot be changed.
2. The home return creep speed at the time of a home return will not be influenced by the start speed.
3. The target speed of each type of operation is not influenced by the start speed. The positioning unit operates at the preset target speed regardless of the preset startup speed.

13.8 Target Speed Change Function (For unit version Ver.1.3 or later only)

13.8.1 Function Explanation

The target speed change function is used to change the target speed on an active positioning table to an arbitrary speed. Even when the speed changes, the operation amount in the table does not change.

■ Use Conditions

The use conditions of the target speed change function are as follows.

A: Available, N/A: Not available

Control method	Single axis control	A	<ul style="list-style-type: none"> In the case of the synchronous control, the speed can be changed only for the master axis. (Slave axes operate according to the master axis.)
	Interpolation control	N/A	
	Synchronous control	A	
Operation pattern	E point	A	<ul style="list-style-type: none"> The speed can be changed more than once in one table.
	P point	A	<ul style="list-style-type: none"> The speed cannot be changed during the deceleration in accordance with the stop operation.
	C point	A	<ul style="list-style-type: none"> The speed cannot be changed during the deceleration in the C point control.
	J point	N/A	<ul style="list-style-type: none"> The speed cannot be changed during the dwell time in the C point control.
	JOG operation	N/A	<ul style="list-style-type: none"> For the J point control, use "J point speed change contact" to change the speed.
	Repeat control	A	<ul style="list-style-type: none"> For the JOG operation, change "JOG operation target speed" directly to change the speed.

Supplementary Functions

■ Speed change method

Speed direct specification	<p>This is a method in which a desired speed is specified directly and the change is requested by I/O.</p> <p>The valid range of the function can be selected from two patterns, which are "Active table only" and "Active table to completion of operation".</p>
Ratio specification (Override)	<p>This is a function to change a set speed using a specified ratio (%).</p> <p>The change request by I/O is not necessary, and the change is reflected when the set value (ratio) is changed.</p> <p>The function is valid for all the positioning operations after the set timing.</p> <p>The ratio specification also becomes valid when the speed is changed by the speed direct specification.</p>

13.8.2 Setting Procedures and Operations (Speed Direct Specification Method)

■ Setting procedures and operations of speed direct specification method

The target speed change function in the speed direct specification method is activated by the following procedure during a positioning operation.

1. Set "Change mode selection" and "Change speed" in the shared memory.
2. Turn on the "Speed change request" contact during a positioning operation.

* "Speed change reception annunciation" turns ON when the speed change is actually started.
 * Once the "Speed change request" contact turns OFF, the "Speed change reception annunciation" also turns OFF.

(Note 1) The acceleration time to the change speed and the deceleration time from the change speed follows the setting values of the active table.

(Note 2) The movement amount does not change when the speed change is performed.

■ Setting parameters of speed direct specification method

The following parameters are used in the target speed change function of the speed direction specification method.

Positioning operation change setting area

Unit memory No. (Hex)	Name	Default	Description
UM17C01			Area for setting the range of the positioning speed change.
UM17C11	Positioning speed change		0000H: Active table only
UM17C21	Change mode selection	H0	0001H: Active table to E point table (until the completion of the operation)
UM17C31			In the case of other values, the unit operates as the setting of 0000H (Active table only).
UM17C71			
UM17C02 UM17C03			
UM17C12 - UM17C13	Positioning speed change		Area for setting a change speed for changing the positioning speed.
UM17C22 - UM17C23	Change speed	K100	Set using unit system conversion values. 1 to 32,767,000 (Specified unit system)
UM17C32 - UM17C33			
UM17C72 - UM17C73			

(Note) The unit memory numbers in the above table are for the axis 1, axis 2, axis 3, axis 4 and virtual axis from the top.

■ Example of operation (1) Speed direct specification, Active table only

Parameter	Setting value
Change mode selection	0000H (Active table only)
Change speed	150,000 (pps)

A	Speed change request contact turns ON.
B	Only the speed of the table 1 is changed to 150,000 pps.
C	The speeds of the table 2 and 3 do not change.

■ Example of operation (2) Speed direct specification, Active table to E point table (until the completion of the operation)

Parameter	Setting value
Change mode selection	0001H (Active table to E point table)
Change speed	150,000 (pps)

A	Speed change request contact turns ON.
B	The speeds of all consecutive tables are changed to 150,000 pps.

Supplementary Functions

■ Example of operation (For repetitive operations)

When the speed change (speed direct specification, active table only) is performed during the positioning repeat operation, only the speed of the active table in an active repeat period is changed.

A	Only the speed of the table 1 in the first repeat period is changed to 150,000 pps.
B	The speeds of the table 1 in the second and third repeat periods are not changed.

13.8.3 Setting Procedures and Operations (Ratio Specification Method)

■ Setting procedures and operations of ratio specification method (Override)

When setting the ratio specification, the command speed is immediately reflected in the specified ratio once the "Ratio specification" in the shared memory is changed.

(Note 1) The acceleration time to the change speed and the deceleration time from the change speed follows the setting values of the active table.

(Note 2) The movement amount does not change when the speed change is performed.

■ Setting parameters of ratio specification method

The following parameters are used in the target speed change function of the ratio specification method.

Positioning operation change setting area

Unit memory No. (Hex)	Name	Default	Description
UM17C00			
UM17C10	Positioning speed change		
UM17C20			
UM17C30	Ratio specification (Override)	K100	Area for setting the change ratio (override) to the command speed for the positioning speed change. The speed change request by I/O is not necessary, and the change becomes valid when the set value (ratio) is set.
UM17C70			1 to 300 (%)

(Note) The unit memory numbers in the above table are for the axis 1, axis 2, axis 3, axis 4 and virtual axis from the top.

Supplementary Functions

■ Example of Operation

When changing the ratio from 100% to 150%

Parameter	Setting value
Ratio specification	100 (%) to 150 (%)

A	The ratio specification is changed from 100 to 150 (%).
B	All consecutive tables follow the set ratio.

13.9 Movement Amount Change Function (For unit version Ver.1.3 or later only)

13.9.1 Function Explanation

- The movement amount change function is used to change the movement amount on an active positioning table to an arbitrary amount.
- Even when the movement amount is changed, the target speed is the same.

■ Use Conditions

The use conditions of the movement amount change function are as follows.

A: Available, N/A: Not available

Control method	Single axis control	A	<ul style="list-style-type: none"> In the case of the synchronous control, the movement amount can be changed only for the master axis. (Slave axes operate according to the master axis.)
	Interpolation control	N/A	
	Synchronous control	A	
Operation pattern	E point	A	<ul style="list-style-type: none"> The movement amount can be changed more than once in one table.
	P point	A	<ul style="list-style-type: none"> The movement amount cannot be changed during the deceleration in accordance with the stop operation.
	C point	A	<ul style="list-style-type: none"> The movement amount cannot be changed during the deceleration in the C point control.
	J point	N/A	<ul style="list-style-type: none"> The movement amount cannot be changed during the dwell time in the C point control.
	JOG operation	N/A	
	Repeat control	A	

13.9.2 Setting Procedures and Operations

■ Setting procedures and operations of movement amount change function

The movement amount change function is activated by the following procedure during a positioning operation.

1. Set "Change movement amount" in the shared memory.
2. Turn on the "Movement amount change request" contact during a positioning operation.

* "Movement amount change reception annunciation" turns ON when the movement amount change is actually started.

* Once the "Speed change request" contact turns OFF, the "Speed change reception annunciation" also turns OFF.

■ Setting parameters

The following parameters are used in the movement amount change function.

Positioning operation change setting area

Unit memory No. (Hex)	Name	Default	Description
UM17C0A - UM17C0B			
UM17C1A - UM17C1B			
UM17C2A - UM17C2B	Positioning movement amount change		Area for setting a change movement amount for changing the positioning movement amount.
UM17C3A - UM17C3B	Change movement amount	H0	-1,073,741,823 to 1,073,741,823 (Specified unit system)
UM17C7A - UM17C7B			

(Note) The unit memory numbers in the above table are for the axis 1, axis 2, axis 3, axis 4 and virtual axis from the top.

■ Example of operation (1) When reducing the movement amount (Change movement amount > Current value)

Parameter	Setting value
Control method	Incremental
Positioning movement amount (Before change)	10,000 (pls)
Positioning movement amount (After change)	7,000 (pls)

A	Movement amount change request contact ON
---	---

■ Example of operation (2) When reducing the movement amount (Change movement amount < Current value)

Parameter	Setting value
Control method	Incremental
Positioning movement amount (Before change)	10,000 (pls)
Positioning movement amount (After change)	1,000 (pls)

A	Movement amount change request contact ON
---	---

Supplementary Functions

■ Example of operation (3) When a continuous table operation is performed (Incremental)

Parameter	Setting value
Control method	Incremental
First table positioning movement amount (Before change)	5,000 (pls)
First table positioning movement amount (After change)	8,000 (pls)

A	Movement amount change request contact ON
B	Because of the increment setting, the stop position of the table 2 also changes.

■ Example of operation (4) When a continuous table operation is performed (Absolute)

Parameter	Setting value
Control method	Absolute
First table positioning movement amount (Before change)	5,000 (pls)
First table positioning movement amount (After change)	8,000 (pls)

A	Movement amount change request contact ON
B	Because of the absolute setting, the stop position of the table 2 does not change.

■ Example of operation (For repetitive operations)

When the movement amount change is performed during the positioning repeat operation, only the movement amount of the active table in an active repeat period is changed.

■ Auxiliary output when changing movement amounts

Even if the movement amount is changed when the auxiliary output is set in the delay mode, the auxiliary contact turns ON at the position of the delay ratio to the movement amount before the change. If the delay ratio is set to 100%, however, the auxiliary contact turns ON on the completion of the operation.

Supplementary Functions

14

Programming Cautions

14.1 Programming Cautions

14.1.1 Turning Off Power Supply Clears Contents of Unit Memory

The unit memory data of the positioning unit will be cleared when the PLC is turned off.

14.1.2 Not Going to Other Operation from Current Operation

Automatic operation (positioning control) or manual operation (JOG operation, home return, or pulser operation) that has started with the start contact turned ON will continue even if the contact of other operation turns ON.

However, the stop operation (deceleration stop, emergency stop, system stop) can be executed during other types of operation.

14.1.3 Operation with the PLC Set to PROG. Mode from RUN Mode

Automatic operation (positioning control) or manual operation (JOG operation, home return, or pulser operation) that has started with the start contact turned ON will continue even if the PLC is switched to PROG. mode from RUN mode.

14.1.4 Types of Positioning Data Setting Areas

The positioning unit has a standard 600-point positioning data setting area and 25-point extended area with the following characteristics. Use either of them according to the application.

■ Comparison of standard area and expansion area

Items	Standard area	Extended area
No. of positioning data tables	600 tables	25 tables
Table number	1 to 600	10001 to 10025
Positioning parameter settings on Configurator PM7 (note 1)	Available	Available
Positioning data settings on Configurator PM7 (note 2)	Available Data that has been set is downloaded along with other project data including the program to the CPU unit. Positioning data will be calculated and each type of operation will be ready to start when the power is turned on or the CPU unit is set to RUN mode.	Not available
Positioning data setting with user program (note 2)	Available Each type of operation will be ready to start after the data is transferred to the unit memory (UM) area with the user program and a recalculation request is made.	Available Each type of operation will be ready to start after the data is transferred to the unit memory (UM) area with the user program. No recalculation request is required.
Characteristics	In the case of setting positioning data with the Configurator PM7, the start will be quicker than that with the extended area used.	In the case of setting positioning data with a user program, the start will be quicker than that with the standard area used.
Application	Suitable to applications where the movement amount, target speed, and other positioning data are determined.	This is suitable for cases where positioning data fluctuates according to the operation results of the PLC.

(Note 1): Positioning parameters refer to operating conditions, such as the JOG operation and home return conditions along with the limit input logic, and deceleration stop time.

(Note 2): Positioning data refers to the individual positioning information such as the movement amount, target speed, acceleration and deceleration time, and operating pattern data, and other individual positioning information.

■ Calculation of reconstructing of standard area

The calculation of reconstruction (recalculation) will be required if the standard positioning data area is overwritten with a user program. If the data is not recalculated after rewriting the positioning table by the program, note that the operation will be executed with the previous positioning table. The recalculation procedure is as follows:

1. Change the positioning table in the unit memory.
2. Turn ON the recalculation request signal (Y7) in the I/O area.
3. Check that the recalculation completion signal (X7) in the I/O area turns ON, and start a desired type of operation.

(Note) The I/O numbers of the recalculation request signal (Y7) and the recalculation completion signal (X7) vary with the first word number allocated to the unit.

◆ REFERENCE

For the difference in programming method between the standard area and extended area, refer to Section 18 Sample program.

15

Errors and Warnings

15.1 About Errors and Warnings

15.1.1 Errors and Warnings

If any operational unconformity occurs in the positioning unit, an error or warning will occur. When an error or warning occurs, the following operation will be performed.

Errors	Occurs in any abnormal conditions. When a motor is operating, the operation stops. The motor stopped due to the occurrence of error will not be activated until the error clear is executed.
Warnings	Occurs if there is any operational unconformity but not abnormal. The operation can continue even after the occurrence of warnings, and the motor continues running if the motor is operating.

15.1.2 Check and Clearing with Configurator PM7

It is possible to check and clear data on an axis-by-axis basis by selecting [Online] → [Data monitor] on the Configurator PM7 programming tool.

15.1.3 Check and Clearing with User Program

■ Check on error and warning information

- Use the dedicated command PERED (to get errors and warnings) and read information.

Error and warning codes are stored as shown below.

DT100	Error code
DT101	Warning code

■ Clearing all axes with UCLR command

- When the dedicated UCLR command (to clear errors and warnings), the errors and warnings on all the axes of the positioning unit will be cleared.

■ Clearing with I/O signal on each axis

- It is possible to clear errors and warnings on an axis-by-axis basis by turning ON the error/warning clear request flags allocated to the I/O area. The following program shows the clearing of errors on each axis.

■ I/O signal allocation

Signal name	1st axis	2nd axis	3rd axis	4th axis	Virtual axis
Error annunciation	X60	X61	X62	X63	X67
Warning annunciation	X68	X69	X6A	X6B	X6F
Request error clear	Y60	Y61	Y62	Y63	Y67
Request warning clear	Y68	Y69	Y6A	Y6B	Y6F

(Note 1): The I/O numbers in the above table show relative addresses based on the base word number. I/O numbers actually used vary with the number of the slot where the unit is installed and the first word number.

15.1.4 Error and Warning Logs

There are log areas to store the error/warning logs within the positioning unit.

Error log	Up to 7 error codes can be stored for each axis.
Warnings log	Up to 7 warning codes can be stored for each axis.

- Once an error/warning occurs, the error/warning code will be stored in the log area of the axis causing the error.
- When an error/warning that is not related to axes occurs, such as a failure in the unit, the error/warning code will be stored in the log areas of all the axes.
- The positioning setting menu of the programming tool makes it possible to check only the latest error and warning codes on each axis.
- When referring the error and warning logs for each axis, read the following memory from the PLC.

Error log area (unit memory)

UM 00128 ~ UM 00137	Error log area of axis 1
UM 00138 ~ UM 00147	Error log area of axis 2
UM 00148 ~ UM 00157	Error log area of axis 3
UM 00158 ~ UM 00167	Error log area of axis 4
UM 00198 ~ UM 001A7	Error log area of virtual axis

UM 00128	–
UM 00129	No. of occurrences of errors
UM 0012A	Error code annunciation buffer 1
UM 0012B	
UM 0012C	Error code annunciation buffer 2
UM 0012D	
UM 0012E	Error code annunciation buffer 3
UM 0012F	
UM 00130	Error code annunciation buffer 4
UM 00131	
UM 00132	Error code annunciation buffer 5
UM 00133	
UM 00134	Error code annunciation buffer 6
UM 00135	
UM 00136	Error code annunciation buffer 7
UM 00137	

Warning log area (unit memory)

UM 001C0 ~ UM 001CF	Warning log area of axis 1
UM 001D0 ~ UM 001DF	Warning log area of axis 2
UM 001E0 ~ UM 001EF	Warning log area of axis 3
UM 001F0 ~ UM 001FF	Warning log area of axis 4
UM 00230 ~ UM 0023F	Warning log area of virtual axis

UM 001C0	–
UM 001C1	No. of occurrences of warnings
UM 001C2	Warning code annunciation buffer 1
UM 001C3	
UM 001C4	Warning code annunciation buffer 2
UM 001C5	
UM 001C6	Warning code annunciation buffer 3
UM 001C7	
UM 001C8	Warning code annunciation buffer 4
UM 001C9	
UM 001CA	Warning code annunciation buffer 5
UM 001CB	
UM 001CC	Warning code annunciation buffer 6
UM 001CD	
UM 001CE	Warning code annunciation buffer 7
UM 001CF	

Number of occurrences of errors/warnings	Stores the number of occurrences of errors and warnings.
Error/warning annunciation buffers	Stores error and warning codes. Errors and warnings are stored in chronological order beginning with buffer 1, followed by buffer 2, 3, etc.

15.2 Changes in Recovery from Errors

15.2.1 Outline

The method to recover from error occurrence varies according to the states when errors occur.

Status if an error occurs	Description	Error type
Recoverable state (Yes)	<ul style="list-style-type: none">After an error occurs, the operating axes stop.After an error occurs, the Positioning Unit can recover from the error at any timing.	All errors Type
Unrecoverable state (No)	<ul style="list-style-type: none">A critical error on the positioning unit systemIf an unrecoverable error occurs, the power supply of the positioning unit should be turned off and on.	System Error Axis operation error

15.3 Error Code Table

15.3.1 System Error (from 1000H)

These are the errors that occur due to any failure within the positioning unit. The system errors are defined as fatal errors for the system. Except for some items, the power supply must be turned off and on again to recover from the errors.

Error code	Error name	Description	Object	Recovered	Countermeasures
1000H	System runaway	System runaway If the error occurs, the ALARM LED on the positioning unit will be lit.	All axes	No	Turn off the power supply and turn it on again. If an error occurs repeatedly, consult your Panasonic representative.
1001H	Hardware error	An error has occurred in a hardware test with the power supply turned on.	All axes	No	
1002H	Unit error	Any error has occurred in the internal processing.	All axes	No	
1003H	System processing error	An error has occurred in the system processing due to some reason.	All axes	Yes	Check the settings. If an error occurs repeatedly with the correct set values, consult your Panasonic representative.
1020H	Tool operation abnormal end	An error in communication with the PC has occurred while operating the programming tool with the positioning setting menu.	All axes	Yes	Check the connection of the cable connecting the PC and PLC. Reboot the PC.
1030H	CPU unit error	An alarm has occurred to the CPU unit.	All axes	No	Check the condition of the CPU unit. Turn off the power supply and turn it on again.
1031H	CPU unit operation mode error	The system in operation has come to a stop because the CPU unit is switched to PROG. Mode.	All axes	Yes	Check the condition of the CPU unit. Set the CPU unit to RUN Mode.

15.3.2 Axis operation error (from 3000H)

These are the errors that will occur while various operations are being executed.

Error code	Error name	Description	Object	Recovered	Countermeasures
3010H	Limit + signal detection	The input on the positive side of the limit has turned ON.	Each axis	Yes	Move the motor into the range of the limit by an appropriate mode, such as JOG operation.
3011H	Limit – signal detection	The input on the negative side of the limit has turned ON.	Each axis	Yes	Check the limit signal is correct.
3012H	Limit signal error	Both inputs on the positive and negative sides of the limit have turned ON.	Each axis	Yes	Check the status of the limit signal.
3020H	Software limit (positive side) detection	The movement amount of the motor has exceeded the upper limit of the software limit.	Each axis	Yes	Move the motor into the range of the software limit by an appropriate mode, such as JOG operation.
3021H	Software limit (negative side) detection	The movement amount of the motor has exceeded the lower limit of the software limit.	Each axis	Yes	Check the set values of the software limit.
3025H	Command speed operation error 1	The internal operation of command speed failed due to overflow.	Each axis	Yes	Lower the set speed. Check the settings of the pulse number per rotation and movement amount per rotation.
3026H	Command speed operation error 2		Each axis	Yes	
3027H	Command speed operation error 3		Each axis	Yes	
3030H	Axis operation error	An error has occurred in the operation processing of each axis due to some reason.	Each axis	Yes	Check the set values and parameters for the positioning unit. If an error occurs repeatedly with the correct set values, consult your Panasonic representative.
3031H	Operation abnormal end	An error has occurred in the operation processing of each axis due to some reason.	Each axis All axes	Yes	If an error occurs repeatedly, consult your Panasonic representative.
3032H	Axis group operation error	Axis group settings are changed while the positioning unit is in operation or a stop request is being made. Axis group settings are outside the range.	Each axis	Yes	Changing the axis group should be performed when the axes are not in operation. Do not make a stop request, either. Check the axis group settings.
3033H	Interpolation operation error	The operation has stopped due to an error in another interpolation axis during interpolation.	Each axis	Yes	Check the set values for positioning data on interpolation. If an error occurs repeatedly with the correct set values, consult your Panasonic representative.

Errors and Warnings

Error code	Error name	Description	Object	Recovered	Countermeasures
3034H	Axis group not settable (In pulser operation)	The axis group settings are changed while the positioning unit is in pulser operation.	Each axis	Yes	Changing the axis group should be performed when the pulser operation enabled signal is OFF.
3035H	Positioning movement amount error	The positioning movement amount has exceeded the upper or lower limit.	Each axis	Yes	Check the set value.
3040H	Synchronous operation group error	The synchronous group is changed while the positioning unit is in synchronous operation or a stop request is being made. The settings of axis groups are outside the range. An error has occurred during a home return while the positioning unit is in synchronous operation.	Each axis	Yes	Changing the synchronous group should be performed when the busy signal for the axes to be synchronized is OFF. It should be performed when various stop request signals (system stop, emergency stop, deceleration stop) are OFF.
3042H	Synchronous operation home return error	The home return process was executed with setting the synchronous operation to "Enabled" when using synchronous mode A. A method other than the usable home return methods was executed when using synchronous mode B.	Each axis	Yes	Set the simultaneous operation to "Disabled" while the positioning unit is in synchronous mode A. Select a usable home return method while the positioning unit is in synchronous mode B.
3043H	Synchronous operation error	The operation has stopped as an error occurred on another axis while the positioning unit is in synchronous operation.	Each axis	Yes	Check the unit setting of the stopped axis. If an error occurs repeatedly with the correct set values, consult your Panasonic representative.
3044H	Synchronous operation not settable (In pulser operation)	The setting of the synchronous operation was changed while the positioning unit is in pulser operation.	Each axis	Yes	Changing the setting of the synchronous operation should be performed when the pulser operation enabled signal is OFF.
3045H	Synchronous axis difference check error	The difference between the movement amounts of the target axes under synchronous control exceeded the specified difference.	Each axis	Yes	Check the operation of the target axes for the synchronous operation.
3046H	Automatic movement amount check error	The automatic movement amount check function has detected that the difference between the instruction value and feedback value is in excess of the preset automatic movement amount.	Each axis	Yes	Check the operation of the target axes. Check the parameters of the automatic check function of movement amount.

15.3.3 Set Value Error (from 4000H)

The following errors occur to various set values made in the positioning setting menu of the programming tool and ladder programs.

Error code	Error name	Description	Object	Recovered	Countermeasures
4000H	The settings of axis groups are not correct	The settings of axis groups are not correct.	Each axis	Yes	<p>Check the following items in the settings of the axis group and independent axis.</p> <ul style="list-style-type: none"> • The same axis number has been registered in more than one group. • Four or more axes have been set in one group. • The group is composed of one axis only.
4002H	Unit setting error	The unit system for the axis setting is out of the range.	Each axis	Yes	<p>Check if the unit is one of the followings.</p> <p>pulse, μm, inch, degree</p>
4004H	Pulse number error per rotation	The pulse number is out of the range.	Each axis	Yes	<p>Check the set value.</p> <p>If the set value is out of the range, reduce it by the following formula.</p>
4005H	Movement amount error per rotation	The movement amount is out of the range.	Each axis	Yes	$(\text{Pulse number per rotation}) / (\text{Movement amount per rotation})$

Errors and Warnings

Error code	Error name	Description	Object	Recovered	Countermeasures
4010H	Software limit setting error	The upper or lower limit value of software limit is out of the range.	Each axis	Yes	
4020H	Limit stop deceleration time error	The limit stop deceleration time is out of the range.	Each axis	Yes	
4021H	Error stop deceleration time error	The error stop deceleration time is out of the range.	Each axis	Yes	
4022H	Emergency stop deceleration time error	The emergency stop deceleration time is out of the range.	Each axis	Yes	
4028H	Auxiliary output setting error	The settings of auxiliary output are not correct. A mode other than With mode or Delay mode for the auxiliary output mode has been set. The auxiliary output delay ratio while the positioning unit is in Delay mode is not 0 to 100 (%).	Each axis	Yes	Check the set value. If an error occurs repeatedly with the correct set values, consult your Panasonic representative.
4030H	Synchronous group setting error	The same axis has been set for the synchronous groups 1 and 2. Either master axis or slave axis has not been set. Multiple axes have been set for the master or slave axis. The same axis has been set for the master and slave axes. The slave axis has been set to the interpolation group.	Each axis	Yes	
4031H	Synchronous operation mode setting error	Operation settings for the synchronous operation differential check function are incorrect.	Each axis	Yes	
4042H	Pulser setting error	The pulser input mode is incorrect. Pulser operation method is incorrect. Pulser operation max. speed is incorrect.	Each axis	Yes	Check the set value. If an error occurs repeatedly with the correct set values, consult your Panasonic representative.
4043H	Pulse operation disabled error	The pulse input application is not set to pulser for the axis for which pulse input is permitted.	Each axis	Yes	Check the pulse input application. Set the input application to pulser at the time of using the pulser.

Error code	Error name	Description	Object	Recovered	Countermeasures
4044H	Speed factor error	The setting of the speed factor is out of the range.	Each axis	Yes	Check the set value. If an error occurs repeatedly with the correct set values, consult your Panasonic representative.
4050H	Startup speed error	The startup speed is out of the range.	Each axis	Yes	
4080H	JOG positioning acceleration/deceleration type error	The acceleration/deceleration method of the JOG positioning is out of the range.	Each axis	Yes	
4081H	JOG positioning deceleration time error	The deceleration time of the JOG positioning is out of the range.	Each axis	Yes	
4082H	JOG positioning acceleration time error	The acceleration time of the JOG positioning is out of the range.	Each axis	Yes	
4083H	JOG positioning target speed error	The target speed of the JOG positioning is out of the range.	Each axis	Yes	
4102H	Home return target speed error	The target speed of the home return is out of the range.	Each axis	Yes	
4105H	Home return acceleration time error	The acceleration time of the home return is out of the range.	Each axis	Yes	
4106H	Home return deceleration time error	The deceleration time of the home return is out of the range.	Each axis	Yes	
4107H	Home return setting code error	The home return setting code is incorrect.	Each axis	Yes	
4110H	Home return creep speed error	The creep speed of the home return is out of the range.	Each axis	Yes	
4111H	Home return returning direction error	The moving direction of the home return is incorrect	Each axis	Yes	
4112H	Home return limit error	The limit switch is disabled. (It occurs when the home return method is set to the limit method 1 or 2.)	Each axis	Yes	
4113H	Home return disable error by synchronous setting	The pulse input application for the target axis is set to feedback and the pulse input is set to synchronous master.	Each axis	Yes	
4120H	Coordinate origin error	The coordinate origin is out of the range.	Each axis	Yes	
4201H	JOG operation target speed error	The target speed of the JOG operation is out of the range.	Each axis	Yes	
4203H	JOG operation acceleration/deceleration type error	The acceleration/deceleration type of the JOG operation is incorrect.	Each axis	Yes	
4204H	JOG operation acceleration time error	The acceleration time of the JOG operation is out of the range.	Each axis	Yes	
4205H	JOG operation deceleration time error	The deceleration time of the JOG operation is out of the range.	Each axis	Yes	

Errors and Warnings

Error code	Error name	Description	Object	Recovered	Countermeasures
4250H	Current value update error	The set value of the current value update is out of the range.	Each axis	Yes	
4301H	Absolute/incremental setting error	A value other than the absolute/increment is set for the move method.	Each axis	Yes	
4302H	Dwell time error	The set value of the dwell time is out of the range.	Each axis	Yes	
4303H	Positioning starting table No. error	The specified table number is 0, or it exceeds the maximum table number.	Each axis	Yes	
4304H	Table setting error	The last table of the positioning setting tables is not the E point.	Each axis	Yes	
4400H	Positioning movement amount setting error	The movement amount of the positioning operation is out of the range.	Each axis	Yes	
4401H	Positioning acceleration/deceleration type error	The acceleration/ deceleration type of the positioning operation is incorrect.	Each axis	Yes	Check the set value. If an error occurs repeatedly with the correct set values, consult your Panasonic representative.
4402H	Positioning acceleration time error	The acceleration time of the positioning operation is out of the range.	Each axis	Yes	
4403H	Positioning deceleration time error	The deceleration time of the positioning operation is out of the range.	Each axis	Yes	
4404H	Positioning target speed error	The target speed of the positioning operation is out of the range.	Each axis	Yes	
4500H	Interpolation type error	The setting of the interpolation type is incorrect.	Each axis	Yes	
4504H	Circular interpolation not executable	The parameter of the circular interpolation (such as center point or pass point) is incorrect.	Each axis	Yes	
4505H	Spiral interpolation not executable	The error occurred while the positioning unit is in spiral interpolation operation as the set value is incorrect.	Each axis	Yes	

Error code	Error name	Description	Object	Recovered	Countermeasures
4600H	Pulse input setting error	The pulse input settings are incorrect.	Each axis	Yes	Check the set value. Check the combination of the input type, input multiplication, and input application.
4605H	Pulse count value change setting error	The set pulse count change value is out of the range.	Each axis	Yes	Check the set value.
4609H	Automatic movement amount check method setting error	The operation of the automatic check function of movement amount is incorrect.	Each axis	Yes	
4610H	Automatic movement amount correction numerator setting error	The automatic movement amount correction numerator is out of the range.	Each axis	Yes	
4611H	Automatic movement amount correction denominator setting error	The automatic movement amount correction denominator is out of the range.	Each axis	Yes	
4613H	Automatic movement amount check interval setting error	The automatic movement amount check interval is out of the range.	Each axis	Yes	

15.3.4 Synchronous Parameter Setting Error (from 5000H)

■ Synchronous parameter: Common error (from 5000H)

Error code	Error name	Description	Object	Recovered	Countermeasures
5000H	Synchronous master setting value error	The setting for the synchronous master axis is incorrect. → Setting error (Value is incorrect.) → Own axis setting	Each axis	Yes	
5001H	Synchronous master pulse input application error	The pulse input other than "High-speed counter" application was selected when setting the synchronous master axis to pulse input.	Each axis	Yes	Check the set value.
5002H	Synchronous setting disable error	The synchronous setting request was made in the following axis setting . - Its own axis (slave axis) is set as the master of another axis. - The master axis is set as the slave axis of another axis. - Its own axis (slave axis) belongs to the interpolation group.	Each axis	Yes	If the error occurs repeatedly with the correct set values, consult your Panasonic representative.
5006H	Synchronous slave single deceleration stop deceleration time	The setting for the synchronous slave single deceleration stop time is incorrect.	Each axis	Yes	

■ Synchronous parameter: Electronic gear related error (from 5100H)

Error code	Error name	Description	Object	Recovered	Countermeasures
5100H	Electronic gear - Gear ratio numerator setting error	The setting for the gear ratio numerator of the electronic gear is incorrect.	Each axis	Yes	Check the set value.
5101H	Electronic gear - Gear ratio denominator setting error	The setting for the gear ratio denominator of the electronic gear is incorrect.	Each axis	Yes	If the error occurs repeatedly with the correct set values, consult your Panasonic representative.
5102H	Electronic gear - Gear ratio change time setting error	The setting for the gear ratio change time of the electronic gear is incorrect.	Each axis	Yes	

■ Synchronous parameter: Clutch related error (from 5200H)

Error code	Error name	Description	Object	Recovered	Countermeasures
5200H	Clutch - Clutch ON trigger type setting error	The setting for the clutch ON trigger type is incorrect.	Each axis	Yes	Check the set value. If the error occurs repeatedly with the correct set values, consult your Panasonic representative.
5201H	Clutch - Clutch ON edge selection setting error	The setting for the clutch ON edge selection is incorrect.	Each axis	Yes	
5203H	Clutch - Clutch OFF trigger type setting error	The setting for the clutch OFF trigger type is incorrect.	Each axis	Yes	
5204H	Clutch - Clutch OFF edge selection setting error	The setting for the clutch OFF edge selection is incorrect.	Each axis	Yes	
5207H	Clutch - Clutch ON method setting error	The setting for the clutch ON method is incorrect.	Each axis	Yes	
5208H	Clutch - Clutch ON slip method setting error	The setting for the clutch ON slip method is incorrect.	Each axis	Yes	
5209H	Clutch - Clutch ON slip time setting error	The setting for the clutch ON slip time is incorrect.	Each axis	Yes	
5210H	Clutch - Clutch ON slip curve selection setting error	The setting for the clutch ON slip curve is incorrect.	Each axis	Yes	
5211H	Clutch - Clutch OFF method setting error	The setting for the clutch ON method is incorrect.	Each axis	Yes	
5212H	Clutch - Clutch OFF slip method setting error	The setting for the clutch OFF slip method is incorrect.	Each axis	Yes	
5213H	Clutch - Clutch OFF slip time setting error	The setting for the clutch OFF slip time is incorrect.	Each axis	Yes	
5214H	Clutch - Clutch OFF slip curve selection setting error	The setting for the clutch OFF slip curve is incorrect.	Each axis	Yes	

Errors and Warnings

■ Synchronous parameter: Electronic cam related error (from 5300H)

Error code	Error name	Description	Object	Recovered	Countermeasures
5300H	Electronic cam - Cam control synchronous master axis cycle setting error	The setting for the cam control synchronous master axis cycle is incorrect.	Each axis	Yes	Check the set value. If the error occurs repeatedly with the correct set values, consult your Panasonic representative.
5301H	Electronic cam - Used cam pattern no. setting error	The used cam pattern number is out of the range. The used cam pattern number is not registered.	Each axis	Yes	
5302H	Electronic cam - Cam stroke amount setting error	The setting for the cam stroke amount is incorrect.	Each axis	Yes	

■ Cam pattern related error (from 5400H)

Error code	Error name	Description	Object	Recovered	Countermeasures
5400H	Cam pattern resolution setting error	The setting for the cam pattern resolution is out of the range.	Each axis	Yes	
5401H	Cam pattern set number setting error	The cam pattern set number is out of the range.	Each axis	Yes	
5402H	Cam pattern section function setting error	The setting for the cam pattern section function is out of the range.	Each axis	Yes	
5403H	Cam pattern control start position setting error	The setting for the cam pattern control start position is out of the range.	Each axis	Yes	
5404H	Cam pattern start phase setting error	The start phase setting for each section of cam pattern is out of the range.	Each axis	Yes	
5405H	Cam pattern displacement setting error	The displacement for each section of cam pattern is out of the range.	Each axis	Yes	Check the set value. If the error occurs repeatedly with the correct set values, consult your Panasonic representative.
5406H	Cam pattern cam curve no. setting error	The curve number for each section of cam pattern is out of the range.	Each axis	Yes	
5410H	Adjustment data total no. setting error	The total number of cam pattern adjustment data is out of the range.	Each axis	Yes	
5411H	Adjustment data no. setting error	The number of cam pattern adjustment data is out of the range. (cam pattern unit)	Each axis	Yes	
5413H	Adjustment data control point setting error	The control point of cam pattern adjustment data is out of the range.	Each axis	Yes	
5414H	Out-of-range adjustment data setting error	The adjustment value of cam pattern adjustment data is out of the range.	Each axis	Yes	

15.4 List of Warning Codes

15.4.1 Unit Warning (from B000H)

These are the warning codes to be given when the warnings occurred in the positioning unit.

Error code	Error name	Description	Object	Recovered	Countermeasures
B000H	Tool operation	<p>The following request signals were turned ON by the host PLC while the positioning unit is in tool operation.</p> <ul style="list-style-type: none"> Positioning start request flag (each axis) Home return request flag (each axis) JOG forward/reverse rotation request flag (each axis) 	Each axis	Yes	<p>No requests from the PLC can be executed while the positioning unit is in tool operation.</p> <p>The following requests, however, can be executed from the PLC while the positioning unit is in tool operation.</p> <ul style="list-style-type: none"> Deceleration stop request flag (each axis) Emergency stop request flag (each axis) System stop request flag (all axes) Pulser operation enabled flag (each axis)
B010H	Duplicate start	<p>The same axis was requested to start even though the axis operation has not completed.</p>	Each axis	Yes	<p>No requests to any axes in operation can be executed.</p> <p>The following requests, however, can be executed while the positioning unit is in operation.</p> <ul style="list-style-type: none"> Deceleration stop request flag (each axis) Emergency stop request flag (each axis) System stop request flag (all axes)
B030H	J-point simultaneous start warning	<p>The J-point speed change contact and J-point positioning start contact turn ON simultaneously during the JOG positioning (J-point) operation.</p> <p>The J-point contact are turned ON while the system is accelerating or decelerating the speed</p>	Each axis	Yes	<p>When the both contacts turn ON simultaneously, the J-point positioning start contact will have a priority, and the J-point speed change contact will be ignored.</p> <p>Make settings so that the J-point speed change contact will be turned ON while the positioning unit is in operation at constant speed.</p>

Errors and Warnings

Error code	Error name	Description	Object	Recovered	Countermeasures
B031H	J-point speed change request warning	The J-point speed change contact turned ON when J-point operation is not active.	Each axis	Yes	Check the timing that the J-point speed change request contact turns ON.
B032H	J-point positioning start request warning	The J-point positioning start contact turned ON when J-point operation is not active.	Each axis	Yes	Check the timing that the J-point positioning start contact turns ON.
B045H	Synchronous axis difference check warning	<p>The difference between the movement amounts of the target axes in synchronous operation has exceeded the specified difference threshold.</p> <p>This warning occurs when the synchronous operation mode and synchronous difference check function are set to Warning.</p>	Each axis	Yes	Check the operation of the target axes for the synchronous operation.
B046H	Automatic movement amount check warning	<p>The automatic movement amount check function has detected that the difference between the instruction value and feedback value is in excess of the preset automatic movement amount.</p> <p>This warning occurs when the operation of the automatic check function of movement amount is set to Warning.</p>	Each axis	Yes	Check the operation of the target axes.

Error code	Error name	Description	Object	Recovered	Countermeasures
B048H	Movement amount automatic check warning 2	<p>The difference between the command value and feedback value exceeded the specified movement amount automatic check value with the movement amount automatic check function.</p> <p>This warning occurs under the following conditions.</p> <ul style="list-style-type: none"> - When the command value and feedback value (pulse input) exceeds the check value when the pulse count value has been changed. - When the command value and feedback value exceeds the check value while home return is not performed. 	Each axis	Yes	Check the operation of the target axes.
B050H	Out-of-range output speed upper limit warning	<p>The output exceeds the upper limit for each model by over 10%.</p> <p>Transistor type: 500 Kpps</p> <p>Line driver type: 4 Mpps</p>	Each axis	Yes	Check the setting for the operation speed of the target axes.
B100H	Synchronous setting change disable warning	The change of the synchronous setting was requested on an operating axis.	Each axis	Yes	Changing the synchronous setting should be performed when the busy signal for the axes to be synchronized is off.
B304H	Recalculation error warning	An error has occurred while recalculation processing is in process.	Each axis	Yes	Check the settings for each axis parameter and interpolation group.

Errors and Warnings

16

Troubleshooting

16.1 What to Do If an Error Occurs

16.1.1 Motor is not Rotating or Operating (Pulse Output A and B LEDs are Flashing or Lit)

■ Solution 1: Servo motor

Check that the servo input is ON.

■ Solution 2

Check that the power to the driver is turned on.

■ Solution 3

Check that the positioning unit and driver are wired correctly.

■ Solution 4

Check that the pulse output coincides in setting (CW/CCW or Pulse/Sign setting) with the driver.

16.1.2 Motor is not Rotating or Operating (Pulse Output A and B LEDs are Off)

■ Solution

Review the program.

Points of confirmation

1. Check that the I/O numbers are correct.
2. Check that the start contact has not been overwritten in the program.
3. Check the input logic of the over limit switch. (The error LED is lit if the logic is incorrect.)

16.1.3 Reversed Rotation or Movement Direction

[Example of reversed rotation or movement direction]

■ Solution 1

Check that the positioning unit and driver are wired correctly.

Points of confirmation

Check that the CW/CCW output or Pulse/Sign output is connected to the corresponding input of the driver.

■ Solution 2

Change the pulse output rotation direction of each axis parameter to set the reversed rotating direction.

Troubleshooting

Specifications

17.1 Specifications

17.1.1 General Specifications

Items	Description
Operating ambient temperature	0°C to +55°C
Storage ambient temperature	-40°C to +70°C
Operating ambient humidity	10% to 95%RH (at 25°C with no-condensing)
Storage ambient humidity	10% to 95%RH (at 25°C with no-condensing)
Breakdown voltage	Each external connector pin and entire power supply terminals of CPU unit 500 V AC for 1 minute
Insulation resistance	Each external connector pin and entire power supply terminals of CPU unit 100 MΩ min. (at 500 V DC)
Vibration resistance	Conforming to JIS B 3502 and IEC 61131-2 5 to 8.4 Hz, 3.5-mm single amplitude 8.4 to 150 Hz, acceleration of 9.8 m/s ² 10 sweeps each in X, Y and Z directions (1 octave/min)
Shock resistance	Conforming to JIS B 3502 and IEC 61131-2 147 m/s ² min in X, Y, and Z directions three times each.
Noise resistance	1,000 V [p-p], pulse width of 50 ns/1 µs (by noise simulator)
Environment	Free from corrosive gases and excessive dust.
EC Directive applicable standard	EMC directive: EN 61131-2
Overvoltage category	Category II or lower
Pollution degree	Pollution degree 2 or lower
Internal current consumption	120 mA or less

17.1.2 Performance Specifications

Items	Description			
	2-axis type		4-axis type	
Product no.	AFP7PP02T	AFP7PP02L	AFP7PP04T	AFP7PP04L
Voltage output type	Transistor	Line driver	Transistor	Line driver
No. of control axes	2-axis		4-axis	
Interpolation control	2-axis linear interpolation 2-axis circular interpolation		2-axis linear interpolation, 3-axis linear interpolation, 2-axis circular interpolation and 3-axis spiral interpolation	
No. of occupied I/O points	Input: 192 points/Output: 192 points			
Automatic operation Positioning control	Position specification method	Absolute (absolute positioning) Increment (specified relative position)		
	Position specified unit	Pulse µm (select a minimum instruction unit of 0.1 µm or 1 µm) inch (select a minimum instruction unit of 0.00001 inch or 0.0001 inch) degree (select a minimum instruction unit of 0.1 degree or 1 degree)		
	Position reference range	Pulse: -1,073,741,823 to 1,073,741,823 pulses µm (0.1 µm): -107,374,182.3 to 107,374,182.3 µm µm (1 µm): -1,073,741,823 to 1,073,741,823 µm inch (0.00001 inch): -10,737.41823 to 10,737.41823 inches inch (0.0001 inch): -107,374.1823 to 107,374.1823 inches degree (0.1 degree): -107,374,182.3 to 107,374,182.3 degrees degree (1 degree): -1,073,741,823 to 1,073,741,823 degrees		
	Speed reference range	Pulse: 1 to 32,767,000 pps µm: 1 to 32,767,000 µm/s inch: 0.001 to 32,767.000 inch/s degree: 0.001 to 32,767.000 rev/s		
	Operation max. speed	500 kpps	4 Mpps	500 kpps
	Acceleration/deceleration pattern	Linear acceleration/deceleration S-shaped acceleration/deceleration		
	Acceleration time	0 to 10,000 ms (adjustable in 1-ms increments)		
	Deceleration time	0 to 10,000 ms (adjustable in 1-ms increments)		
	No. of positioning tables	Each axis: 600 points in standard area and 25 points in extended area		

Specifications

Items				Description	
				2-axis type	4-axis type
Product no.				AFP7PP02T, AFP7PP02L	AFP7PP04T, AFP7PP04L
Automatic operation	Positioning control	Control method	Independent		PTP control (E- and C-point control) CP control (P-point control) Speed control (J-point control)
			2-axis Interpolation	Linear interpolation	E-, P-, C-point control; composite speed or long-axis speed specification
		3-axis Interpolation	Circular interpolation		E-, P-, C-point control; center or passing point specification
			Linear interpolation	E-, P-, C-point control; composite speed or long-axis speed specification	
		Spiral interpolation		E-, P-, C-point control; center or passing point specification	
		Start speed			3 ms max. in standard area and 5 ms max. in extended area
Manual operation	JOG operation	Other functions			0 to 32,767 ms (adjustable in 1-ms increments)
		Speed reference range			Pulse: 1 to 32,767,000 pps μm: 1 to 32,767,000 μm/s inch: 0.001 to 32,767.000 inch/s degree: 0.001 to 32,767.000 rev/s
		Acceleration/deceleration pattern			Linear acceleration/deceleration S-shaped acceleration/deceleration
		Acceleration time			0 to 10,000 ms (adjustable in 1-ms increments)
	Home return	Deceleration time			0 to 10,000 ms (adjustable in 1-ms increments)
		Speed reference range			Pulse: 1 to 32,767,000 pps μm: 1 to 32,767,000 μm/s inch: 0.001 to 32,767.000 inch/s degree: 0.001 to 32,767.000 rev/s
		Acceleration/deceleration pattern			Linear acceleration/deceleration
		Acceleration time			0 to 10,000 ms (adjustable in 1-ms increments)
		Deceleration time			0 to 10,000 ms (adjustable in 1-ms increments)
		Return method			DOG methods (3 types), limit methods (2 types), data set method, and home position method
	Pulser operation	Speed reference range			Operates in synchronization with pulser input

Items			Description			
			2-axis type		4-axis type	
Product no.			AFP7PP02T	AFP7PP02L	AFP7PP04T	AFP7PP04L
Stop functions	Deceleration stop	Deceleration time	Deceleration time while in operation			
	Emergency stop	Deceleration time	0 to 10,000 ms (adjustable in 1-ms increments)			
	Limit stop	Deceleration time	0 to 10,000 ms (adjustable in 1-ms increments)			
	Error stop	Deceleration time	0 to 10,000 ms (adjustable in 1-ms increments)			
	System stop	Deceleration time	Immediate stop (0 ms): All axes comes to a stop			
Other specifications	Software limit function	Setting range	Pulse: -1,073,741,823 to 1,073,741,823 pulses μm (0.1 μm): -107,374,182.3 to 107,374,182.3 μm μm (1 μm): -1,073,741,823 to 1,073,741,823 μm inch (0.00001 inch): -10,737.41823 to 10,737.41823 inches inch (0.0001 inch): -107,374.1823 to 107,374.1823 inches degree (0.1 degree): -107,374,182.3 to 107,374,182.3 degrees degree (1 degree): -1,073,741,823 to 1,073,741,823 degrees			
	Backup		Parameters and positioning data are saved in flash memories (with no batteries)			
	High-speed counter function (note 1)	Counting range	Counting range -2,147,483,648 to 2,147,483,648 pulses			
		Input mode	Phase difference input, direction discrimination input, and individual input (with multiplier function for each mode)			
	<ul style="list-style-type: none"> • Limit input CWL, CCWL monitor, and near (DOG) monitor • Auxiliary output code and auxiliary output contact 					
Internal current consumption (5 V DC)			300 mA or less	300 mA or less	300 mA or less	300 mA or less
External power supply	Voltage	21.6 to 26.4 V DC				
		Current consumption	50 mA	90 mA	50 mA	90 mA
Weight			Approx. 130 g	Approx. 150 g	Approx. 130 g	Approx. 150 g

(Note 1): The pulser input function and high-speed counter function use the same pulse input terminal. Therefore, the both functions cannot be used simultaneously.

17.2 I/O Number Allocation

The following I/O numbers indicate offset addresses. The I/O numbers actually allocated are based on the first word number allocated to the unit.

Example) If the first word number of the unit is 10, the positioning ready signal will be X100.

Contact allocation	Target axis	Name	Description
WX0	X0	All axes	Ready announce Indicates that the unit is ready to operate internally, and announces the start of the system.
	X1	—	—
	X2	—	—
	X3	—	—
	X4	All axes	Tool operation in progress Contact to indicate that the positioning unit is in tool operation. The start from I/O is not available during the Tool operation. A warning will occur if you attempt to do so.
	X5	All axes	Axis group setting done Makes axis group setting changes in the unit with the axis group setting request contact (Y5) turned ON after making setting changes in the axis group with the program. The contact turns ON upon completion of the setting changes.
	X6	All axes	Axis parameter setting done Makes axis parameter setting changes in the unit with the axis parameter setting request contact (Y6) turned ON after making setting changes in the axis parameter with the program. The contact turns ON upon completion of the setting changes.
	X7	All axes	Recalculation done If the recalculation request contact (Y7) turns ON, the positioning data of the unit memory (standard area) will be restructured. This contact will turn ON after restructuring completes. If the recalculation request contact (Y7) turns ON again, this contact will be off once. Note) It is used only when the positioning data has been rewritten by ladder programs.
WX1	X8 XF	—	—
	X10	1st axis	Servo lock Turns ON only if there is servo ON output with servo ON signals (Y8 to YB).
	X11	2nd axis	
	X12	3rd axis	
	X13	4th axis	
	X14 X17	—	—
	X18	1st axis	BUSY Turns ON when the corresponding axis is operating.
	X19	2nd axis	
	X1A	3rd axis	
	X1B	4th axis	
X1C X1E	—	—	—
	X1F	Virtual axis	BUSY Turns ON when the virtual axis is operating.

Contact allocation	Target axis	Name	Description	
WX2	X20	1st axis	Operation done	Turns ON when the operation instruction for the corresponding axis completed and the position deviation became in the specified completion width.
	X21	2nd axis		Turns ON when the operation for all the tables completed for P-point control and C-point control of the automatic operation.
	X22	3rd axis		After this contact turns ON, the ON-state will continue until the next control is activated.
	X23	4th axis		
	X24	–	–	–
	X26	–	–	–
	X27	Virtual axis	Operation done	Turns ON when the operation instruction to the virtual axis is completed.
	X28	1st axis	Home return done	Turns ON when the home return operation for the corresponding axis is completed.
	X29	2nd axis		After this contact turns ON, the ON-state will continue until the next control is activated.
	X2A	3rd axis		
	X2B	4th axis		
WX3	X2C	–	–	–
	X2E	–	–	–
	X2F	Virtual axis	Home return done	Turns ON when the home return operation for the virtual axis is completed.
	X30	1st axis	Home position	A contact to monitor external home position input signal for the corresponding axis. The input logic can be changed in the parameter-setting menu of the Configurator PM7.
	X31	2nd axis		
	X32	3rd axis		
	X33	4th axis		
	X34	–	–	–
	X37	–	–	–
	X38	1st axis	Near home	A contact to monitor external near home position input signal for the corresponding axis. The input logic can be changed in the parameter-setting menu of the Configurator PM7.
	X39	2nd axis		
	X3A	3rd axis		
	X3B	4th axis		
	X3C	–	–	–
	X3F	–	–	–

Specifications

Contact allocation	Target axis	Name	Description
WX4	X40 X47	—	—
	X48 1st axis	Auxiliary contact	Turns ON when the corresponding positioning table of the corresponding axis is executed.
	X49 2nd axis		
	X4A 3rd axis		
	X4B 4th axis		
	X4C X4E	—	—
	X4F Virtual axis	Auxiliary contact	Turns ON when the corresponding positioning table of the virtual axis is executed.
WX5	X50 1st axis	Limit +	Monitor contact of the limit + and -.
	X51	Limit -	Decelerates to stop when the limit input that is on an extension of the operating direction turns ON while the positioning unit is in positioning operation, JOG operation, or pulser operation.
	X52 2nd axis	Limit +	The deceleration stop time during the limit input can be changed in the unit memory.
	X53	Limit -	
	X54 3rd axis	Limit +	It will be the contact for the automatic inversion when performing a home return.
	X55	Limit -	
	X56 4th axis	Limit +	The input logic can be changed in the parameter-setting menu of the Configurator PM7.
	X57	Limit -	
	X58 X5F	—	—
WX6	X60 1st axis	Error annunciation	Turns ON when an error occurs on the corresponding axis.
	X61 2nd axis		The contacts of all axes turn ON if all axes have errors.
	X62 3rd axis		The details of the error can be confirmed in the error annunciation area of the unit memory.
	X63 4th axis		
	X64 X66	—	—
	X67 Virtual axis	Error annunciation	Turns ON when an error occurs on the virtual axis.
	X68 1st axis	Warning annunciation	Turns ON when a warning occurs on the corresponding axis.
	X69 2nd axis		The contacts of all axes turn ON if a warning occurs on all axes.
	X6A 3rd axis		The details of the warning can be confirmed in the warning annunciation area of the unit memory.
	X6B 4th axis		
	X6C X6E	—	—
	X6F Virtual axis	Warning annunciation	Turns ON when a warning occurs on the virtual axis.

Contact allocation	Target axis	Name	Description
WX7 X70 X7F	—	—	—
WX8 X80 X81 X82 X83	1st axis	Synchronous setting done	Changes synchronous settings in the unit with the synchronous setting request contact (Y80 to Y83) turned ON after changing the settings of synchronous control with the program. The contact turns ON upon completion of the setting changes. This contact turns OFF with the synchronous setting request contact (Y80 to Y83) turned OFF.
	2nd axis		
	3rd axis		
	4th axis		
WX8 X84 X87	—	—	—
	1st axis	Synchronous cancel alarm	Turns ON when the synchronous operation of the positioning unit is canceled with the synchronous setting cancel request contact (Y88 to Y8B) turned ON. The synchronous operation of axes cannot be executed if this contact is ON for the axes.
	2nd axis		
	3rd axis		
WX8 X88 X89 X8A X8B	4th axis		
	—	—	—
	—	—	—
	—	—	—
WX9 X90 X91 X92 X93	1st axis	Slave axis gear ratio change annunciation	Makes gear ratio changes with the slave axis gear ratio change request contact (Y90 to Y93) The contact for the corresponding axis will turn ON after the gear ratio is changed.
	2nd axis		
	3rd axis		
	4th axis		
WX9 X94 X97	—	—	—
	—	—	—
	—	—	—
	—	—	—
WX9 X98 X99 X9A X9B	1st axis	Slave axis clutch operation annunciation	The clutch will start operating when the slave axis clutch ON re-request contact (Y98 to Y9B) or clutch OFF request contacts (Y100 to 103) turn ON. The contact for the corresponding axis will turn ON after completion of the operation of the clutch.
	2nd axis		
	3rd axis		
	4th axis

Specifications

Contact allocation	Target axis	Name	Description
WY0	Y0	All axes	System stop Contact for requesting the system stop. When it turns ON, all axes will stop at the deceleration time 0.
	Y1	—	—
	Y2	—	—
	Y3	—	—
	Y4	—	—
	Y5	All axes	Axis group setting change request This contact will turn ON after the axis group settings are changed.
	Y6	All axes	Axis parameter setting change request This contact will turn ON after the axis parameter settings are changed.
	Y7	All axes	Request recalculation Turns ON this signal when each positioning data (standard area) in the unit memory was changed. The positioning data after the table number starting the recalculation specified in the unit memory can be restructured and will be executable by turning ON this signal. When restructuring of the positioning data completes, the recalculation done contact (X7) will turn ON. Note) It is used only when the positioning data has been rewritten by ladder programs.
	Y8	1st axis	Servo ON The servo ON signal for the corresponding axis turns ON at the ON edge of this contact. The servo ON signal will not turn OFF automatically while the positioning unit is in program mode. To turn OFF the servo ON signal, turn ON the servo OFF request (Y50 to Y53). (The operation is the edge type.)
	Y9	2nd axis	
	YA	3rd axis	
	YB	4th axis	
	YC	—	—
	YF	—	
WY1	Y10	1st axis	Positioning start Requests the positioning control of the corresponding axis. The starting table is specified in the area for specifying the positioning control starting table number in the unit memory. (The operation is the edge type.)
	Y11	2nd axis	
	Y12	3rd axis	
	Y13	4th axis	
	Y14	—	—
	Y16	—	
	Y17	Virtual axis	Positioning start Requests the positioning control of the virtual axis.
	Y18	1st axis	Home return start Requests the home return of the corresponding axis. (The operation is the edge type.)
	Y19	2nd axis	
	Y1A	3rd axis	
	Y1B	4th axis	
	Y1C	—	—
	Y1E	—	
	Y1F	Virtual axis	Home return start Requests the home return of the virtual axis. The home return of the virtual axis is possible only by data setting.

Contact allocation	Target axis	Name	Description
WY2	Y20	1st axis	JOG forward
			JOG reverse
	Y21	2nd axis	JOG forward
			JOG reverse
	Y22	3rd axis	JOG forward
			JOG reverse
	Y23	4th axis	JOG forward
			JOG reverse
	Y24		Requests the JOG operation for the corresponding axis. (The operation is of level type.) If this contact turns ON while the positioning unit is in tool operation, a warning will be output.
	Y25		
	Y26		
	Y27		
	Y28		
	Y2E		
	Y2E	Virtual axis	JOG forward
	Y2F		JOG reverse
WY3	Y30	1st axis	Requests the emergency stop of the corresponding axis. (The operation is of level type.) Note) The deviation counter cannot be cleared.
	Y31	2nd axis	
	Y32	3rd axis	
	Y33	4th axis	
	Y34		
	Y36		
	Y37	Virtual axis	Emergency stop
	Y38	1st axis	Requests the deceleration stop of the corresponding axis. (The operation is of level type.) Note) The deviation counter cannot be cleared.
	Y39	2nd axis	
	Y3A	3rd axis	
	Y3B	4th axis	
	Y3C		
	Y3E		
	Y3F	Virtual axis	Deceleration stop

Specifications

Contact allocation	Target axis	Name	Description	
WY4	Y40	1st axis	Pulser operation enabled	Requests the permission for the pulser operation of the corresponding axis. (The operation is of level type.)
	Y41	2nd axis		
	Y42	3rd axis		
	Y43	4th axis		
	Y44	—	—	—
	Y46	—	—	—
WY4	Y47	Virtual axis	Pulser operation enabled	Requests the permission for the pulser operation of the virtual axis.
	Y48	1st axis	J-point speed change contact	By turning ON this signal while the positioning unit is in J-point operation, the speed changes to the target speed in the specified acceleration/deceleration time and pattern. (The operation is the edge type.)
	Y49	2nd axis		
	Y4A	3rd axis		
	Y4B	4th axis		
	Y4C	—	—	—
WY5	Y4E	—	—	—
	Y4F	Virtual axis	J-point speed change contact	Changes the target speed during the JOG (J-point) positioning of the virtual axis.
	Y50	1st axis	Servo OFF request	Turns OFF the servo ON signal for the corresponding axis. The servo ON signal is turned OFF at the ON edge of this contact. (The operation is the edge type.)
	Y51	2nd axis		
	Y52	3rd axis		
	Y53	4th axis		
WY5	Y54	—	—	—
	Y57	—	—	—
	Y58	1st axis	J-point positioning start	The positioning unit will go to the next table processing when this signal turns ON during the JOG (J-point) positioning of the corresponding axis. (The operation is the edge type.)
	Y59	2nd axis		
	Y5A	3rd axis		
	Y5B	4th axis		
WY5	Y5C	—	—	—
	Y5E	—	—	—
	Y5F	Virtual axis	J-point positioning start	The positioning unit will go to the next table processing when this signal turns ON during the JOG (J-point) positioning of the virtual axis.

Contact allocation	Target axis	Name	Description		
WY6	Y60	1st axis	Error clear request	Requests the error clear of the corresponding axis.	
	Y61	2nd axis		The processing to recover from errors is performed and the error logs are cleared by turning ON this signal.	
	Y62	3rd axis		Note) Unrecoverable errors cannot be recovered even if this signal turns ON.	
	Y63	4th axis			
	Y64	-	-	-	
	Y66				
	Y67	Virtual axis	Error clear request	Requests the error clear of the virtual axis.	
	Y68	1st axis	Request warning clear	Requests the warning clear of the corresponding axis. The warning logs are cleared by turning ON this signal.	
	Y69	2nd axis			
	Y6A	3rd axis			
	Y6B	4th axis			
WY7	Y6C	-	-	-	
	Y6E				
	Y6F	Virtual axis	Request warning clear	Requests the warning clear of the virtual axis.	
WY7	Y70	-	-	-	
	Y7F				
WY8	Y80	1st axis	Synchronous setting request	This contact will turn ON after the synchronous operation settings are changed.	
	Y81	2nd axis		Turn ON this contact for reflecting the setting changes in the synchronous control common area of the unit memory. This flag is an edge trigger.	
	Y82	3rd axis			
	Y83	4th axis			
	Y84	-	-	-	
	Y87				
	Y88	1st axis	Synchronous cancel request	Turns ON the contact for the axis to cancel the synchronous operation.	
	Y89	2nd axis		The unit will not perform the synchronous operation of the axis for which this contact is ON.	
	Y8A	3rd axis		Turn ON this contact for canceling the synchronous state temporarily during synchronous control. To make the synchronous state, turn OFF this contact.	
	Y8B	4th axis			
	Y8C	-		-	
	Y8F				

Specifications

Contact allocation	Target axis	Name	Description	
WY9	Y90	1st axis	Slave axis gear ratio change request	A gear ratio change is made with the contact for the corresponding axis turned ON while the positioning unit is in synchronous operation. (The operation is the edge type.)
	Y91	2nd axis		
	Y92	3rd axis		
	Y93	4th axis		
	Y94	—	Slave axis clutch ON request	The engagement of the clutch starts by turning ON the contact for the corresponding axis while the positioning unit is in synchronous operation. No axes start unless the clutch is used. (Set the operation to level type, rising edge, or falling edge.)
	Y97	—		
	Y98	1st axis		
	Y99	2nd axis		
WY10	Y9A	3rd axis	Slave axis clutch OFF request	No axes start unless the clutch is used. (Set the operation to rising edge or falling edge.)

17.3 Entire Configuration of Memory Unit Area

The unit memory is in control of parameter and positioning data set values for the positioning unit.

All set values are set with the programming tool software or a user program.

Area name	Unit memory address	Name of each individual area	
Common area	UM 00000 to UM 003FF	Setting parameter control area	
		Operating speed factor area	
		Axis group setting area	
		Current value update data area	
		Positioning table setting area	
		Positioning control area	
		Error annunciation & clear area	
		Warning annunciation & clear area	
		Pulse count control area	
		Synchronous control monitor area	
Each axis information area (Note)	UM 00400 to UM 007FF	1st axis	Each axis information & monitor area
		2nd axis	Each axis information & monitor area
		3rd axis	Each axis information & monitor area
		4th axis	Each axis information & monitor area
		Virtual axis	Each axis information & monitor area
Each axis setting	UM 00800 to UM 02FFF	1st axis	Parameter setting area
			Positioning data setting area (600 standard points and 25 expansion points)
	UM 03000 to UM 057FF	2nd axis	Parameter setting area
			Positioning data setting area (600 standard points and 25 expansion points)
	UM 05800 to UM 07FFF	3rd axis	Parameter setting area
			Positioning data setting area (600 standard points and 25 expansion points)
	UM 08000 to UM 0A7FF	4th axis	Parameter setting area
			Positioning data setting area (600 standard points and 25 expansion points)
	UM 12000 to UM 147FF	Virtual axis	Parameter setting area
			Positioning data setting area (600 standard points and 25 expansion points)

(Note): Check that the positioning done flag (X0) is turned ON in the case of reading each axis information area with a program.

Specifications

Area name	Unit memory address	Name of each individual area	
Synchronous control setting area	UM 16000 to UM 16006F	1st axis	Synchronous control common setting area
			Electronic gear setting area
			Clutch setting area
			Electronic cam setting area
	UM 16070 to UM 160DF	2nd axis	Synchronous control common setting area
			Electronic gear setting area
			Clutch setting area
			Electronic cam setting area
	UM 160E0 to UM 1614F	3rd axis	Synchronous control common setting area
			Electronic gear setting area
			Clutch setting area
			Electronic cam setting area
	UM 16150 to UM 161BF	4th axis	Synchronous control common setting area
			Electronic gear setting area
			Clutch setting area
			Electronic cam setting area
Positioning operation change setting area	UM 17C00 to UM 17C0F	1st axis	Speed change setting area Movement amount change setting area
	UM 17C10 to UM 17C1F	2nd axis	Speed change setting area Movement amount change setting area
	UM 17C20 to UM 17C2F	3rd axis	Speed change setting area Movement amount change setting area
	UM 17C30 to UM 17C3F	4th axis	Speed change setting area Movement amount change setting area
	UM 17C70 to UM 17C7F	Virtual axis	Speed change setting area

Note) For reading each axis information area with the program, check if the ready positioning flag (X0) turns ON before reading it.

17.4 Details of Common Area in Unit Memory

17.4.1 Common Area Configuration

The common area is allocated to the head of the unit memory to make common settings for each axis.

17.4.2 Setting Parameter Control Area

Set a recalculation starting table number in order to recalculate the positioning data in the standard area.

Unit memory no. (Hex)	Name	Description	Default	Setting range	Set unit
UM 00085	Recalculation starting table number	If the ON state of the recalculation request signal (contact Y7) is detected, the positioning unit will recalculate positioning data on all axes beginning with this table number up to number 600.	1	1 to 600	—

17.4.3 Operating Speed Factor Area

Unit memory no. (Hex)	Name	Description	Default	Setting range	Set unit
UM 00088	Operating speed factor	<p>It is possible to perform all types of axial control (positioning, JOG, and home return control) at a magnified rate of this speed.</p> <p>Values can be input in percent within a range of 1 to 100 (%).</p>	100	1 to 100	%

17.4.4 Axis Group Setting Area

Set an interpolation group on an axis-by-axis basis in this area.

Unit memory no. (Hex)	Name	Description			
UM 000B0	Group A axis settings	Make independent and interpolation settings for each axis in this area. In the case of interpolation, each axis belongs to group A, B, C, or D. For example, if the 1st, 2nd, and 3rd axes belong to group A for three-axis interpolation, set the three corresponding bits for the interpolation settings for group A to 1. In the case of single independent settings, the axis will not belong to any group. Then turn ON the corresponding bit for the following independent axis settings.			
UM 000B1	Group B axis settings	A maximum of three axes can be set for interpolation per group. Duplicated settings for the same axis in different groups are not possible.			
UM 000B2	Group C axis settings	bit	Name	Default	Description
UM 000B3	Group D axis settings	0	Group attribute of 1st axis	0	0: Not belongs to any group. 1: Belongs to a group.
		1	Group attribute of 2nd axis	0	An error occurs if four or more bits for the same group are set to 1 or the same axis is set to 1 for another group.
		2	Group attribute of 3rd axis	0	
		3	Group attribute of 4th axis	0	
		15 to 4	—	—	—

Unit memory no. (Hex)	Name	Description			
UM 000B4	Independent axis settings	Set the corresponding bit to 1 in this area if the axis is not related to interpolation.			
		bit	Name	Default	Description
		0	Group attribute of 1st axis	0	0: Not belongs to any group. 1: Belongs to a group.
		1	Group attribute of 2nd axis	0	An error will occur if the same axis is set to 1 in another group.
		2	Group attribute of 3rd axis	0	
		3	Group attribute of 4th axis	0	
15 to 4		—	—	—	—

17.4.5 Current Value Update Data Area

To change the current value of each axis under the control of the positioning unit, store the changed coordinates in this area and turn ON the current value update request flag.

Unit memory no. (Hex)	Name	Description																																						
UM 000C0	Current value update request flag	<p>Only when the corresponding bit for each axis changes to 1 from 0, the current coordinate controlled by the positioning unit to the following current value.</p> <p>After the change, the positioning unit will clear the corresponding bits to 0 automatically.</p> <table border="1"> <thead> <tr> <th>bit</th><th>Name</th><th>Default</th><th>Description</th></tr> </thead> <tbody> <tr> <td>0</td><td>Current value update request for 1st axis</td><td>0</td><td rowspan="8">0: No change 1: Update the current value of the corresponding axis (The positioning unit will set the value to 0 automatically after execution.)</td></tr> <tr> <td>1</td><td>Current value update request for 2nd axis</td><td>0</td></tr> <tr> <td>2</td><td>Current value update request for 3rd axis</td><td>0</td></tr> <tr> <td>3</td><td>Current value update request for 4th axis</td><td>0</td></tr> <tr> <td>4</td><td>—</td><td>—</td></tr> <tr> <td>5</td><td>—</td><td>—</td></tr> <tr> <td>6</td><td>—</td><td>—</td></tr> <tr> <td>7</td><td>Current value update request for virtual axis</td><td>0</td></tr> <tr> <td>15 to 8</td><td>—</td><td>—</td><td>—</td><td>—</td><td>—</td></tr> </tbody> </table>				bit	Name	Default	Description	0	Current value update request for 1st axis	0	0: No change 1: Update the current value of the corresponding axis (The positioning unit will set the value to 0 automatically after execution.)	1	Current value update request for 2nd axis	0	2	Current value update request for 3rd axis	0	3	Current value update request for 4th axis	0	4	—	—	5	—	—	6	—	—	7	Current value update request for virtual axis	0	15 to 8	—	—	—	—	—
bit	Name	Default	Description																																					
0	Current value update request for 1st axis	0	0: No change 1: Update the current value of the corresponding axis (The positioning unit will set the value to 0 automatically after execution.)																																					
1	Current value update request for 2nd axis	0																																						
2	Current value update request for 3rd axis	0																																						
3	Current value update request for 4th axis	0																																						
4	—	—																																						
5	—	—																																						
6	—	—																																						
7	Current value update request for virtual axis	0																																						
15 to 8	—	—	—	—	—																																			
UM 000C8	Current value update coordinate of 1st axis	Stores the coordinate to be preset as the updating of the current value of 1st axis.																																						
UM 000C9																																								
UM 000CA	Current value update coordinate of 2nd axis	Stores the coordinate to be preset as the updating of the current value of 2nd axis.																																						
UM 000CB																																								
UM 000CC	Current value update coordinate of 3rd axis	Stores the coordinate to be preset as the updating of the current value of 3rd axis.																																						
UM 000CD																																								
UM 000CE	Current value update coordinate of 4th axis	Stores the coordinate to be preset as the updating of the current value of 4th axis.																																						
UM 000CF																																								
UM 000D6	Current value update coordinate of virtual axis	Stores the coordinate to be preset as the updating of the current value of virtual axis.																																						
UM 000D7																																								

17.4.6 Positioning Control Starting Table Number Setting Area

Set the starting table number of positioning data on each axis at the time of starting positioning control.

The setting ranges are 1 to 600 for the standard area and 10001 to 10025 for the extended area.

Unit memory no. (Hex)	Name	Description	Default	Setting range	Set unit
UM 00100	The starting table number for the positioning control of 1st axis	Stores the positioning control starting table number of the 1st axis	1	1 to 600 10001 to 10025	–
UM 00101	The starting table number for the positioning control of 2nd axis	Stores the positioning control starting table number of the 2nd axis	1	1 to 600 10001 to 10025	–
UM 00102	The starting table number for the positioning control of the 3rd axis	Stores the positioning control starting table number of the 3rd axis	1	1 to 600 10001 to 10025	–
UM 00103	The starting table number for the positioning control of 4th axis	Stores the positioning control starting table number of the 4th axis	1	1 to 600 10001 to 10025	–
UM 00107	The starting table number for the positioning control of the virtual axis	Stores the positioning control starting table number of the virtual axis	1	1 to 600 10001 to 10025	–

17.4.7 Positioning Control Area

- Set the number of repetitions of positioning control per axis.
- The positioning unit repeats positioning control for the number of repetitions set and finishes operating.

The number of repetitions will be reset to the default value on completion of positioning control.

Unit memory no. (Hex)	Name	Description	Default	Setting range	Set unit
UM 00108	Number of 1st axis positioning repetitions	Stores the number of times for repeating the operation starting from the positioning control starting table number of the 1st axis until the E-point. If 255 is stored, the positioning unit repeats positioning control an unlimited number of times until you manually stop the operation.	0	0 to 255	Times
UM 00109	Number of 2nd axis positioning repetitions	Stores the number of times for repeating the operation starting from the positioning control starting table number of the 2nd axis until the E-point. If 255 is stored, the positioning unit repeats positioning control an unlimited number of times until you manually stop the operation.	0	0 to 255	Times
UM 0010A	Number of 3rd axis positioning repetitions	Stores the number of times for repeating the operation starting from the positioning control starting table number of the 3rd axis until the E-point. If 255 is stored, the positioning unit repeats positioning control an unlimited number of times until you manually stop the operation.	0	0 to 255	Times
UM 0010B	Number of 4th axis positioning repetitions	Stores the number of times for repeating the operation starting from the positioning control starting table number of the 4th axis until the E-point. If 255 is stored, the positioning unit repeats positioning control an unlimited number of times until you manually stop the operation.	0	0 to 255	Times
UM 0010F	Number of Virtual axis positioning repetitions	Stores the number of times for repeating the operation starting from the positioning control starting table number of the virtual axis until the E-point. If 255 is stored, the positioning unit repeats positioning control an unlimited number of times until you manually stop the operation.	0	0 to 255	Times

17.4.8 Error Annunciation & Clear Area

If errors (involving a stoppage) occur, data on the errors along with the number of errors will be stored on an axis-by-axis basis in this area. If the error clear is executed, the errors and the number of errors that have occurred will be cleared once. Then errors will be judged again. Therefore, the same errors will occur if the error conditions continue. If a unit level error, such as an entire network failure occurs, the data on all the axes will be stored in the error annunciation buffer. Up to 7 errors are stored in the error log.

Errors can be cleared not only in this area but also with the error clear contact.

Unit memory no. (Hex)	Name	Description			
UM 00111	Error clear settings on an axis-by-axis basis	Clears errors on an axis-by-axis basis			
		bit	Name	Default	Description
		0	Error clear for 1st axis	0	0: No error clear 0 to 1: Error clear executed (The positioning unit will set the value to 0 automatically after execution.)
		1	Error clear for 2nd axis	0	
		2	Error clear for 3rd axis	0	
		3	Error clear for 4th axis	0	
		4	—	—	
		5	—	—	
		6	—	—	
		7	Error clear for virtual axis	0	
		15 to 8	—	—	—
UM 00129	No. of occurrences of errors on 1st axis	Annunciates the number of occurrences of errors on the 1st axis.			
UM 0012A	1st axis error code annunciation buffer 1	The latest error codes are stored in order from buffer number 1.			
UM 0012B	1st axis error code annunciation buffer 2				
UM 0012C	1st axis error code annunciation buffer 3				
UM 0012D	1st axis error code annunciation buffer 4				
UM 0012E	1st axis error code annunciation buffer 5				
UM 0012F	1st axis error code annunciation buffer 6				
UM 00130	1st axis error code annunciation buffer 7				
UM 00131	No. of occurrences of errors on 2nd axis	Annunciates the number of occurrences of errors on the 2nd axis.			
UM 00132	2nd axis error code annunciation buffer 1	A code will be annunciated if an error occurs.			
UM 00133	2nd axis error code annunciation buffer 2	A code will be annunciated if an error occurs.			
UM 00134	2nd axis error code annunciation buffer 3	A code will be annunciated if an error occurs.

UM 001A6	Virtual axis error code annunciation buffer 7	A code will be annunciated if an error occurs.
UM 001A7		

17.4.9 Warning Annunciation & Clear Area

If warnings (not involving a stoppage) occur, data on the warnings along with the number of warnings will be stored on an axis-by-axis basis in this area. If the warning clear is executed, the warnings and the number of warnings occurred will be cleared once. Then warnings will be judged again. Therefore, the same warnings will occur if the warning conditions continue. The number of warnings for each axis is annunciated. If a total warning occurs, the data on all the axes will be stored in the warning annunciation buffer. Up to 7 warnings are stored in the warning log.

Warnings can be cleared not only in this area but also with the warning clear contact.

Unit memory no. (Hex)	Name	Description			
UM 001A9	Warning clear settings on axis-by-axis basis	Clears warnings on an axis-by-axis basis			
		bit	Name	Default	Description
		0	Warning clear on 1st axis	0	0: No warning clear
		1	Warning clear on 2nd axis	0	0 to 1: Warning clear executed (The positioning unit will set the value to 0 automatically after execution.)
		2	Warning clear on 3rd axis	0	
		3	Warning clear on 4th axis	0	
		4	—	—	
		5	—	—	
		6	—	—	
		7	Warning clear for virtual axis	0	
		15 to 8	—	—	
UM 001C1	No. of occurrences of warnings	Annunciates the number of occurrences of warnings on the 1st axis			
UM 001C2	1st axis warning code annunciation buffer 1	The latest warning codes are stored in order from buffer number 1.			
UM 001C3					
UM 001C4	1st axis warning code annunciation buffer 2				
UM 001C5					
UM 001C6	1st axis warning code annunciation buffer 3				
UM 001C7					
UM 001C8	1st axis warning code annunciation buffer 4				
UM 001C9		Annunciates the number of occurrences of warnings on the 2nd axis			
UM 001CA	1st axis warning code annunciation buffer 5				
UM 001CB					
UM 001CC	1st axis warning code annunciation buffer 6				
UM 001CD					
UM 001CE	1st axis warning code annunciation buffer 7				
UM 001CF					
UM 001D1	No. of occurrences of warnings on the 2nd axis	A code will be annunciated if a warning occurs.			
UM 001D2	2nd axis warning code annunciation buffer 1				
UM 001D3					
UM 001D4	2nd axis warning code annunciation buffer 2				
UM 001D5					
UM 001D6	2nd axis warning code annunciation buffer 3				
UM 001D7					

Unit memory no. (Hex)	Name	Description
UM 001D8	2nd axis warning code annunciation buffer 4	A code will be annunciated if a warning occurs.
UM 001D9	2nd axis warning code annunciation buffer 5	A code will be annunciated if a warning occurs.
UM 001DA	2nd axis warning code annunciation buffer 6	A code will be annunciated if a warning occurs.
UM 001DB	2nd axis warning code annunciation buffer 7	A code will be annunciated if a warning occurs.
UM 001DC	No. of occurrences of warnings on the 3rd axis	Annunciates the number of occurrences of warnings on the 3rd axis
UM 001DD	3rd axis warning code annunciation buffer 1	A code will be annunciated if a warning occurs.
UM 001DE	3rd axis warning code annunciation buffer 2	A code will be annunciated if a warning occurs.
UM 001DF	3rd axis warning code annunciation buffer 3	A code will be annunciated if a warning occurs.
UM 001E1	3rd axis warning code annunciation buffer 4	A code will be annunciated if a warning occurs.
UM 001E2	3rd axis warning code annunciation buffer 5	A code will be annunciated if a warning occurs.
UM 001E3	3rd axis warning code annunciation buffer 6	A code will be annunciated if a warning occurs.
UM 001E4	3rd axis warning code annunciation buffer 7	A code will be annunciated if a warning occurs.
UM 001E5	No. of occurrences of warnings on the 4th axis	Annunciates the number of occurrences of warnings on the 4th axis
UM 001E6	4th axis warning code annunciation buffer 1	A code will be annunciated if a warning occurs.
UM 001E7	4th axis warning code annunciation buffer 2	A code will be annunciated if a warning occurs.
UM 001E8	4th axis warning code annunciation buffer 3	A code will be annunciated if a warning occurs.
UM 001E9	4th axis warning code annunciation buffer 4	A code will be annunciated if a warning occurs.
UM 001EA	4th axis warning code annunciation buffer 5	A code will be annunciated if a warning occurs.
UM 001EB	4th axis warning code annunciation buffer 6	A code will be annunciated if a warning occurs.
UM 001EC	4th axis warning code annunciation buffer 7	A code will be annunciated if a warning occurs.
UM 001ED	No. of occurrences of warnings on the virtual axis	Annunciates the number of occurrences of warnings on the virtual axis
UM 001F1	4th axis warning code annunciation buffer 1	A code will be annunciated if a warning occurs.
UM 001F2	4th axis warning code annunciation buffer 2	A code will be annunciated if a warning occurs.
UM 001F3	4th axis warning code annunciation buffer 3	A code will be annunciated if a warning occurs.
UM 001F4	4th axis warning code annunciation buffer 4	A code will be annunciated if a warning occurs.
UM 001F5	4th axis warning code annunciation buffer 5	A code will be annunciated if a warning occurs.
UM 001F6	4th axis warning code annunciation buffer 6	A code will be annunciated if a warning occurs.
UM 001F7	4th axis warning code annunciation buffer 7	A code will be annunciated if a warning occurs.
UM 001F8	No. of occurrences of warnings on the virtual axis	Annunciates the number of occurrences of warnings on the virtual axis
UM 001F9	4th axis warning code annunciation buffer 1	A code will be annunciated if a warning occurs.
UM 001FA	4th axis warning code annunciation buffer 2	A code will be annunciated if a warning occurs.
UM 001FB	4th axis warning code annunciation buffer 3	A code will be annunciated if a warning occurs.
UM 001FC	4th axis warning code annunciation buffer 4	A code will be annunciated if a warning occurs.
UM 001FD	4th axis warning code annunciation buffer 5	A code will be annunciated if a warning occurs.
UM 001FE	4th axis warning code annunciation buffer 6	A code will be annunciated if a warning occurs.
UM 001FF	4th axis warning code annunciation buffer 7	A code will be annunciated if a warning occurs.
UM 00231	No. of occurrences of warnings on the virtual axis	Annunciates the number of occurrences of warnings on the virtual axis

17.4.11 Synchronous Control Monitor Area

This is an area for monitoring the setting status of synchronous control.

Unit memory no. (Hex)	Name	Description			Default			
UM 002B0	Monitoring information of synchronous master axis for the 1st axis	Stores the setting status of the master axis under synchronous control.			FFFFH			
		Stored value		Master axis				
		Under synchronization						
		FFFFH	FFFFH					
		0000H	8000H					
		0001H	8001H					
		0002H	8002H					
		0003H	8003H					
		0004H	8004H					
		0010H	8010H					
		0021H	8021H					
		0022H	8022H					
		0023H	8023H					
		0024H	8024H					
UM 002B1	Monitoring selection state of synchronous output function for 1st axis	The state of the synchronous operating function set for the axis is stored.			0000H			
		bit	Functions	Setting				
		0	Electronic gear setting	0: Yes 1: No				
		1	Clutch operation settings					
		2	Electronic cam operation settings					
		3 to 15						
UM 002B2	Monitoring information of synchronous master axis for the 2nd axis	Refer to the description for the 1st axis.			FFFFH			
UM 002B3	Monitoring selection state of synchronous output function for 2nd axis	Refer to the description for the 1st axis.			0000H			
UM 002B4	Monitoring information of synchronous master axis for the 3rd axis	Refer to the description for the 1st axis.			FFFFH			
UM 002B5	Monitoring selection state of synchronous output function for 3rd axis	Refer to the description for the 1st axis.			0000H			
UM 002B6	Monitoring information of synchronous master axis for the 4th axis	Refer to the description for the 1st axis.			FFFFH			
UM 002B7	Monitoring selection state of synchronous output function for 4th axis	Refer to the description for the 1st axis.			0000H			
UM 002BE	Monitoring information of synchronous master axis for the virtual axis	Refer to the description for the 1st axis.			FFFFH			

17.4 Details of Common Area in Unit Memory

Unit memory no. (Hex)	Name	Description	Default
UM 002BF	Monitoring selection state of synchronous output function for virtual axis	0000H (fixed)	0000H

17.4.12 System Operation Setting Area

This is an area for changing the operation of the positioning unit.

Unit memory no. (Hex)	Name	Description
UM 00389	Deceleration stop operation	<p>Specify the operation of the positioning unit with the deceleration stop request signal activated (turned ON).</p> <p>0: Deceleration stop</p> <p>While the positioning unit is in repetitive operation, the positioning unit will come to a stop after the position moves to E-point of the repetitive target.</p> <p>1: Pause</p> <ul style="list-style-type: none">• Performs a deceleration stop, and positioning will restart when the deceleration stop request signal is canceled (turned OFF).• The positioning unit will perform the same operation as a deceleration stop unless the positioning unit is in positioning operation.• While the positioning unit is in repetitive operation, the positioning unit will come to a stop after the position moves to the E-point of the repetitive target, and repetitive operation will restart when the deceleration stop request signal is canceled (turned OFF).• If a system stop or emergency stop is executed while the positioning unit is paused, the pause state will be canceled and the operation will not restart with the deceleration stop request signal is canceled (turned OFF). <p>Default: 0</p>

17.5 Details of Each Axis Information Area in Unit Memory

17.5.1 Each Axis Information & Monitor Area

◆ NOTE

Check that the positioning ready flag (X0) is turned ON in the case of reading each axis information area with a program.

17.5.2 Each Axis Information & Monitor Area

■ 1st axis information

Unit memory no. (Hex)	Name	Description	Default	Setting range	Set unit																			
UM 00431	External terminal input monitor of 1st axis	<p>Stores I/O information connected to each axis.</p> <table border="1"> <thead> <tr> <th>bit</th><th>Name</th><th>Default</th><th>Description</th></tr> </thead> <tbody> <tr> <td>0</td><td>Limit +</td><td>0</td><td rowspan="5">0: Non-active 1: Active</td></tr> <tr> <td>1</td><td>Limit -</td><td>0</td></tr> <tr> <td>2</td><td>Near home</td><td>0</td></tr> <tr> <td>3</td><td>Home position</td><td>0</td></tr> <tr> <td>15 to 4</td><td>-</td><td>-</td></tr> </tbody> </table>	bit	Name	Default	Description	0	Limit +	0	0: Non-active 1: Active	1	Limit -	0	2	Near home	0	3	Home position	0	15 to 4	-	-		
bit	Name	Default	Description																					
0	Limit +	0	0: Non-active 1: Active																					
1	Limit -	0																						
2	Near home	0																						
3	Home position	0																						
15 to 4	-	-																						
UM 00434	Deviation of 1st axis	Stores the maximum value of the deviation (the difference between the pulse input value and instruction value).	-	-	-																			
UM 00435																								
UM 00436	Pulse input value of 1st axis	<p>Stores pulse input values according to the pulse input application (e.g., pulser, feedback pulse, or counter).</p> <p>Pulse input values will be integrated and stored until the pulse input application is changed or the pulse input is cleared.</p>	-	-	pulse																			
UM 00437																								
UM 00438	Implementation or implementation done table of 1st axis	Stores the positioning table number being executed or done.	1	1 to 600	-																			
UM 00439	Auxiliary output code of 1st axis	Stores the auxiliary output code.	0		-																			
UM 0043A	Repeat count set value of 1st axis	<p>Stores the set value for the number of positioning repeat count.</p> <p>This area will be set to 1 if the positioning repeat is not implemented.</p> <p>Stores 255 if the number of positioning repeat times is unlimited.</p>	0	0 to 255	Times																			
UM 0043B	Repeat count current value 1st axis	<p>Stores the number of repeat count in operation.</p> <p>Stores 1 if the positioning repeat is not implemented.</p> <p>Returns to "0" when the repeat count exceeds the upper limit.</p>	0	0 to 65,535	Times																			
UM 0043C	Current value of 1st axis	<p>Stores the current value based on a mechanical origin in pulse units.</p> <p>It will be reset to "0" on the completion of home return.</p> <p>The value will not be updated when the current value update function is executed.</p>	0	-	pulse																			
UM 0043D																								

17.5 Details of Each Axis Information Area in Unit Memory

Unit memory no. (Hex)	Name	Description	Default	Setting range	Set unit
UM 0043E	Unit system conversion current value of 1st axis	Stores the current value based on an electric origin (value set as home position coordinate). Values converted with the unit system (pulse, μ m, inch, degree) selected in each axis setting area are stored.	0	–	–
UM 0043F		When the home return is completed, the value set as home position coordinate will be stored. When "0" is set as home position coordinate, it will be reset to "0". This area is also updated when the current value update function is used.			

Specifications

■ 2nd axis information

Unit memory no. (Hex)	Name	Description
UM 00471	External terminal input monitor of 2nd axis	Refer to the description for the 1st axis.
UM 00474	Deviation of 2nd axis	Refer to the description for the 1st axis.
UM 00476	Pulse input value of 2nd axis	Refer to the description for the 1st axis.
UM 00477		
UM 00478	Implementation or implementation done table of 2nd axis	Refer to the description for the 1st axis.
UM 00479	Auxiliary output code of 2nd axis	Refer to the description for the 1st axis.
UM 0047A	Repeat count set value of 2nd axis	Refer to the description for the 1st axis.
UM 0047B	Repeat count current value of 2nd axis	Refer to the description for the 1st axis.
UM 0047C	Current value of 2nd axis	Refer to the description for the 1st axis.
UM 0047D		
UM 0047E	Unit system conversion current value of 2nd axis	Refer to the description for the 1st axis.
UM 0047F		

■ 3rd axis information

Unit memory no. (Hex)	Name	Description
UM 004B1	External terminal input monitor of 3rd axis	Refer to the description for the 1st axis.
UM 004B4	Deviation of 3rd axis	Refer to the description for the 1st axis.
UM 004B6	Pulse input value of 3rd axis	Refer to the description for the 1st axis.
UM 004B7		
UM 004B8	Implementation or implementation done table of 3rd axis	Refer to the description for the 1st axis.
UM 004B9	Auxiliary output code of 3rd axis	Refer to the description for the 1st axis.
UM 004BA	Repeat count set value of 3rd axis	Refer to the description for the 1st axis.
UM 004BB	Repeat count current value of 3rd axis	Refer to the description for the 1st axis.
UM 004BC	Current value of 3rd axis	Refer to the description for the 1st axis.
UM 004BD		
UM 004BE	Unit system conversion current value of 3rd axis	Refer to the description for the 1st axis.
UM 004BF		

■ 4th axis information

Unit memory no. (Hex)	Name	Description
UM 004F1	External terminal input monitor of 4th axis	Refer to the description for the 1st axis.
UM 004F4	Deviation of 4th axis	Refer to the description for the 1st axis.
UM 004F6	Pulse input value of 4th axis	Refer to the description for the 1st axis.
UM 004F7		
UM 004F8	Implementation or implementation done table of 4th axis	Refer to the description for the 1st axis.
UM 004F9	Auxiliary output code of 4th axis	Refer to the description for the 1st axis.
UM 004FA	Repeat count set value of 4th axis	Refer to the description for the 1st axis.
UM 004FB	Repeat count current value of 4th axis	Refer to the description for the 1st axis.
UM 004FC	Current value of 4th axis	Refer to the description for the 1st axis.
UM 004FD		
UM 004FE	Unit system conversion current value of 4th axis	Refer to the description for the 1st axis.
UM 004FF		

■ Virtual axis information

Unit memory no. (Hex)	Name	Description
UM 005F8	Implementation or implementation done table of virtual axis	Refer to the description for the 1st axis.
UM 005F9	Auxiliary output code of virtual axis	Refer to the description for the 1st axis.
UM 005FA	Repeat count set value of virtual axis	Refer to the description for the 1st axis.
UM 005FB	Repeat count current value of virtual axis	Refer to the description for the 1st axis.
UM 005FC	Current value of virtual axis	Refer to the description for the 1st axis.
UM 005FD		
UM 005FE	Unit system conversion current value of virtual axis	Refer to the description for the 1st axis.
UM 005FF		

17.6 Details of Each Axis Setting Area in Unit Memory

17.6.1 Configuration of Each Axis Setting Area

Each axis setting area stores the parameter setting area and positioning data. The positioning data setting area of each axis consists of a standard area with 600 tables and extended area with 25 tables.

17.6.2 Parameter Setting Area

■ First address of each axis positioning parameter area

Axis	1st axis	2nd axis	3rd axis	4th axis	Virtual axis
Unit memory address	UM 00800	UM03000	UM 05800	UM 08000	UM 12000

■ Positioning parameters

Data in the following format is stored from the first address of positioning parameters for each axis.

Offset address	Name	Default	Setting range and description
000H	Unit setting	0H	<p>Set the movement unit system for the positioning control of each axis. Make sure that all the interpolation axes use the same unit system.</p> <p>0000H: Pulse 0100H: μm (minimum position reference of 0.1 μm) 0101H: μm (minimum position reference of 1 μm) 0200H: inch (minimum position reference of 0.1 inch) 0201H: inch (minimum position reference of 1 inch) 0300H: degree (minimum position reference of 0.1 degree) 0301H: degree (minimum position reference of 1 degree) Any other settings will be errors.</p>
001H	–	–	–
002H	Number of pulses per rotation	1	Set the number of pulses per motor rotation. Settings in mm, inch, or degree are required for pulse count conversion
003H			<p>Setting range: 1 to 32,767 Any other settings will be errors.</p>
004H	Movement amount per rotation	1	<p>Set the movement amount per motor rotation. Settings in mm, inch, or degree are required for pulse count conversion</p> <p>Setting range: 1 to 32,767 Any other settings will be errors.</p>
005H			<p>Set the following range according to the unit setting.</p> <p>μm: 1 μm inch: 1/10,000 inch degree: 1 degree</p>
006H	–	–	–

Specifications

◆ KEY POINTS

The unit memory address of a parameter is based on the first address of the corresponding axis added with the offset address.

The first number of the positioning parameter setting area of each axis.

1st axis	2nd axis	3rd axis	4th axis	Virtual axis
UM 00800	UM 03000	UM 05800	UM 08000	UM 12000

Offset address	Name	Default	Setting range and description																					
007H	Pulse input mode	20H	<p>Makes pulse input signal settings. Make settings according to the application of pulse input.</p> <table border="1"> <thead> <tr> <th>bit</th><th>Name</th><th>Description</th></tr> </thead> <tbody> <tr> <td>0</td><td>Rotating direction</td><td>Set the rotating direction of pulse input 0: Forward 1: Reverse</td></tr> <tr> <td>1</td><td>—</td><td>—</td></tr> <tr> <td>2 to 3</td><td>Pulse input mode</td><td>Set the pulse input mode. Bit3 Bit2 0 0: 2-phase input 0 1: Direction discrimination input 1 0: Individual input 1 1: Reserve (set by default)</td></tr> <tr> <td>4 to 5</td><td>Input multiplication</td><td>Set the desired multiplication of the pulse input count if the pulse input mode (with bits 2 and 3) to 2-phase input. The settings for the axis with the smallest number in the axis group are enabled for interpolation operation. Setting range: 0 to 10,000 (ms) Any other settings will be errors.
005H	Positioning deceleration time		
006H	Positioning target speed (Interpolation speed)	1000	The target axis will operate at target speed in the case of single axis operation and operate at target interpolation speed in the case of interpolation operation. The settings for the axis with the smallest number in the axis group are enabled for interpolation operation. Setting range: 1 to 32,767,000 Any other settings will be errors. Set the following range according to the unit setting. Pulse: 1 to 32,767,000 pps μm: 1 to 32,767,000 μm/s inch: 0.001 to 32,767.000 inch/s degree: 0.001 to 32,767.000 rev/s
007H			

17.6 Details of Each Axis Setting Area in Unit Memory

Offset address	Name	Default	Setting range and description
008H	Positioning movement amount	0	<p>The setting area for the positioning movement amount for positioning operation.</p> <p>The amount of increment movement or absolute coordinates will be set according to the control code settings.</p> <p>Setting range: -1,073,741,823 to 1,073,741,823</p> <p>Any other settings will be errors.</p> <p>Set the following range according to the unit setting.</p> <p>Pulse: -1,073,741,823 to 1,073,741,823 pulses</p> <p>μm (0.1 μm): -107,374,182.3 to 107,374,182.3 μm</p> <p>μm (1 μm): -1,073,741,823 to 1,073,741,823 μm</p> <p>inch (0.00001 inch): -10,737.41823 to 10,737.41823 inches</p> <p>inch (0.0001 inch): -107,374.1823 to 107,374.1823 inch</p> <p>degree (0.1 degree): -107,374,182.3 to 107,374,182.3 degrees</p> <p>degree (1 degree): -1,073,741,823 to 1,073,741,823 degrees</p>
009H			
04AH	Auxiliary point	0	<p>The setting area for auxiliary points (center and passing points) in the case of circular interpolation or spiral interpolation operation.</p> <p>Setting range: -1,073,741,823 to 1,073,741,823</p> <p>Any other settings will be errors.</p> <p>Set the following range according to the unit setting.</p> <p>Pulse: -1,073,741,823 to 1,073,741,823 pulses</p> <p>μm (0.1 μm): -107,374,182.3 to 107,374,182.3 μm</p> <p>μm (1 μm): -1,073,741,823 to 1,073,741,823 μm</p> <p>inch (0.00001 inch): -10,737.41823 to 10,737.41823 inches</p> <p>inch (0.0001 inch): -107,374.1823 to 107,374.1823 inch</p> <p>degree (0.1 degree): -107,374,182.3 to 107,374,182.3 degrees</p> <p>degree (1 degree): -1,073,741,823 to 1,073,741,823 degrees</p>
00BH			
00CH	Dwell Time	0	<p>On completion of the positioning of this table, the operation of the next table will start after stopping the motor for the dwell time in the case of the continuance point (C-point), the dwell time will be ignored in the case of the passing point (P-point), and the positioning done contact will turn ON after a pause of the dwell time in the case of end point (E-point) control.</p> <p>Setting range: 0 to 32,767 (ms)</p> <p>Any other settings will be errors.</p>
00DH	Auxiliary output code	0	<p>Make auxiliary output mode settings for the parameter setting area to specify data to be output to the auxiliary output codes for the each axis information & monitor area.</p> <p>No setting ranges, in particular.</p>
00EH	–	–	–
00FH	–	–	–

◆ KEY POINTS

The unit memory address of each item on the positioning table is based on a separate address allocated to each axis and table added with the offset address.

■ First address of each positioning table

17.7 Unit Memory Synchronous Control Setting Area

17.7.1 Synchronous Control Setting Area

This is an area for monitoring the setting status of synchronous control.

Unit memory no. (Hex)	Description	
UM 16000 - UM1600F	Synchronous setting area of 1st axis	Synchronous control common setting area
UM 16010 - UM1601F		Electronic gear setting area
UM 16020 - UM1604F		Clutch setting area
UM 16050 - UM1606F		Electronic cam setting area
UM 16070 - UM1607F	Synchronous setting area of 2nd axis	Synchronous control common setting area
UM 16080 - UM1608F		Electronic gear setting area
UM 16090 - UM160BF		Clutch setting area
UM 160C0 - UM160DF		Electronic cam setting area
UM 160E0 - UM160EF	Synchronous setting area of 3rd axis	Synchronous control common setting area
UM 160F0 - UM160FF		Electronic gear setting area
UM 16100 - UM1612F		Clutch setting area
UM 16130 - UM1614F		Electronic cam setting area
UM 16150 - UM1615F	Synchronous setting area of 4th axis	Synchronous control common setting area
UM 16160 - UM1616F		Electronic gear setting area
UM 16170 - UM1619F		Clutch setting area
UM 161A0 - UM161BF		Electronic cam setting area
UM 161C0 - UM163FF	(Not used)	

17.7.2 Detailed Information on Synchronous Control Setting Area

Make synchronous control settings in this area. These values set in the Configuration menu will be stored automatically. Therefore, individual settings are not necessary.

■ Synchronous control common setting area

Offset address	Name	Default	Description																						
000H	Each axis synchronous master axis selection	0000H	<p>Set the master axis for each axis.</p> <table border="1"> <tr> <td>Set value</td><td>Master axis</td></tr> <tr> <td>0000H</td><td>No synchronous master axis or the target set axis is the master axis.</td></tr> <tr> <td>0001H</td><td>1st axis</td></tr> <tr> <td>0002H</td><td>2nd axis</td></tr> <tr> <td>0003H</td><td>3rd axis</td></tr> <tr> <td>0004H</td><td>4th axis</td></tr> <tr> <td>0010H</td><td>Virtual axis</td></tr> <tr> <td>0021H</td><td>Pulse input 1</td></tr> <tr> <td>0022H</td><td>Pulse input 2</td></tr> <tr> <td>0023H</td><td>Pulse input 3</td></tr> <tr> <td>0024H</td><td>Pulse input 4</td></tr> </table>	Set value	Master axis	0000H	No synchronous master axis or the target set axis is the master axis.	0001H	1st axis	0002H	2nd axis	0003H	3rd axis	0004H	4th axis	0010H	Virtual axis	0021H	Pulse input 1	0022H	Pulse input 2	0023H	Pulse input 3	0024H	Pulse input 4
Set value	Master axis																								
0000H	No synchronous master axis or the target set axis is the master axis.																								
0001H	1st axis																								
0002H	2nd axis																								
0003H	3rd axis																								
0004H	4th axis																								
0010H	Virtual axis																								
0021H	Pulse input 1																								
0022H	Pulse input 2																								
0023H	Pulse input 3																								
0024H	Pulse input 4																								
001H	Each axis synchronous output function selection	0000H	<p>The state of the synchronous operating function set for the axis is stored.</p> <table border="1"> <tr> <td>bit</td><td>Functions</td><td>Setting</td></tr> <tr> <td>0</td><td>Electronic gear setting</td><td>0: No 1: Yes</td></tr> <tr> <td>1</td><td>Clutch operation settings</td><td></td></tr> <tr> <td>2</td><td>Electronic cam operation settings</td><td></td></tr> <tr> <td>3-15</td><td>Area reserved for system</td><td></td></tr> </table>	bit	Functions	Setting	0	Electronic gear setting	0: No 1: Yes	1	Clutch operation settings		2	Electronic cam operation settings		3-15	Area reserved for system								
bit	Functions	Setting																							
0	Electronic gear setting	0: No 1: Yes																							
1	Clutch operation settings																								
2	Electronic cam operation settings																								
3-15	Area reserved for system																								

■ Electronic gear setting area

Offset address	Name	Default	Description
010H - 011H	Each axis gear ratio numerator	1	1 to 2,147,483,647
012H - 013H	Each axis gear ratio denominator	1	1 to 2,147,483,647
014H	Each axis gear change time	1	1 to 10000

Specifications

■ Clutch setting area

Offset address	Name	Default	Description
020H	Clutch ON trigger types	00H	00H: I/O clutch ON request
021H	Clutch ON edge selection	00H	Set enabled conditions for the trigger signal. 00H: Level 01H: Rising edge 02H: Falling edge
028H	Clutch OFF trigger types	00H	00H: I/O clutch OFF request
029H	Clutch OFF edge selection	00H	Set enabled conditions for the trigger signal. 00H: Level 01H: Rising edge 02H: Falling edge
030H	Clutch ON method	00H	00H: Direct 01H: Slip
032H	Clutch ON slip method	00H	00H: Slip time setting
033H	Clutch ON slip time	1	1 to 10000 ms
036H	Clutch ON slip curve selection	00H	00H: Linear
040H	Clutch OFF method	00H	00H: Direct 01H: Slip
042H	Clutch OFF slip method	00H	00H: Slip time setting
043H	Clutch OFF slip time	1	1 to 10000 ms
046H	Clutch OFF slip curve selection	00H	00H: Linear

■ Electronic cam setting area

Offset address	Name	Default	Description
050H - 051H	Cam control synchronous master axis cycle	1	Settings for cam control synchronous master cycle 1 to 2,147,483,647
053H	Cam pattern number used	1	Registered cam pattern number for use 1 to (16)
054H - 055H	Cam stroke amount	1	Displacement upper limit settings for cam control 1 to 2,147,483,647

17.8 Positioning Operation Change Setting Area (For unit version Ver.1.3 or later only)

17.8.1 Positioning Speed/Movement Amount Change Parameter

■ 1st axis

Unit memory No. (Hex)	Name	Description	Default
UM 17C00	Positioning speed change of 1st axis Ratio specification (Override)	Area for setting the change rate (%) to the ratio specification (override) command speed of the positioning speed change. The speed change request by I/O is not necessary, and the change becomes valid when the set value (ratio) is set. 1 to 300 (%)	100
UM 17C01	Positioning speed change of 1st axis Change mode selection	Area for setting the range of the positioning speed change. 0000H: Active table only 0001H: Active table to E point (until the completion of the operation) In the case of other values, the unit operates as the setting of 0000H (Active table only).	0000H
UM 17C02	Positioning speed change of 1st axis Change speed	Area for setting a change speed for changing the positioning speed. [Speed specification method: Speed direct specification] 1 to 32,767,000 (Specified unit system)	100
UM 17C03			
UM 17C04 - UM 17C09	—	—	—
UM 17C0A	Positioning movement amount change of 1st axis Change movement amount	Area for setting a change movement amount for changing the positioning movement amount. -1,073,741,823 to 1,073,741,823 (Specified unit system)	0

Specifications

■ 2nd axis

Unit memory No. (Hex)	Name	Description
UM 17C10	Positioning speed change of 2nd axis Ratio specification (Override)	Refer to the descriptions of axis 1.
UM 17C11	Positioning speed change of 2nd axis Change mode selection	Refer to the descriptions of axis 1.
UM 17C12	Positioning speed change of 2nd axis	
UM 17C13	Change speed	Refer to the descriptions of axis 1.
UM 17C14 - UM 17C19	—	—
UM 17C1A	Positioning movement amount change of 2nd axis	
UM17C1B	Change movement amount	Refer to the descriptions of axis 1.
UM 17C1C - UM 17C1F	—	—

■ 3rd axis

Unit memory No. (Hex)	Name	Description
UM 17C20	Positioning speed change of 3rd axis Ratio specification (Override)	Refer to the descriptions of axis 1.
UM 17C21	Positioning speed change of 3rd axis Change mode selection	Refer to the descriptions of axis 1.
UM 17C22	Positioning speed change of 3rd axis	
UM 17C23	Change speed	Refer to the descriptions of axis 1.
UM 17C24 - UM 17C29	—	—
UM 17C2A	Positioning movement amount change of 3rd axis	
UM17C2B	Change movement amount	Refer to the descriptions of axis 1.
UM 17C2C - UM 17C2F	—	—

■ 4th axis

Unit memory No. (Hex)	Name	Description
UM 17C30	Positioning speed change of 4th axis Ratio specification (Override)	Refer to the descriptions of axis 1.
UM 17C31	Positioning speed change of 4th axis Change mode selection	Refer to the descriptions of axis 1.
UM 17C32	Positioning speed change of 4th axis	Refer to the descriptions of axis 1.
UM 17C33	Change speed	
UM 17C34 - UM 17C39	—	—
UM 17C3A	Positioning movement amount change of 4th axis	Refer to the descriptions of axis 1.
UM17C3B	Change movement amount	
UM 17C3C - UM 17C3F	—	—

■ Virtual axis

Unit memory No. (Hex)	Name	Description
UM 17C70	Positioning speed change of virtual axis Ratio specification (Override)	Refer to the descriptions of axis 1.
UM 17C71	Positioning speed change of virtual axis Change mode selection	Refer to the descriptions of axis 1.
UM 17C72	Positioning speed change of virtual axis	Refer to the descriptions of axis 1.
UM 17C73	Change speed	
UM 17C74 - UM 17C79	—	—
UM 17C7A	Positioning movement amount change of virtual axis	Refer to the descriptions of axis 1.
UM17C7B	Change movement amount	
UM 17C7C - UM 17C7F	—	—

17.9 Dimensions

■ 2-axis type

(Unit: mm)

■ 4-axis type

(Unit: mm)

18

Sample program

18.1 Basic Configuration and Contact Allocations of Sample Programs

In the sample programs, the internal relays are used for the start contacts of each operation. Connect them to the input contacts such as switches as needed.

■ Basic Configuration

The positioning unit is installed in slot 1. The 1st axis and 2nd axis of the positioning unit connect to a stepping motor each, with the linear interpolation of the 2nd axis sampled. This example is shown on the condition that parameter settings for each axis are made in the positioning setting menu of the programming tool and saved in the positioning unit.

■ Used contacts and data registers

Number	Description
R2	Request home return
R3	Request positioning start
R4	1st axis JOG forward request
R5	1st axis JOG reverse request
R6	2nd axis JOG forward request
R7	2nd axis JOG reverse request
R10	Error clear
R11	Request set value change
R100	Operation enabled flag for 1st axis
R101	1st axis JOG forward OFF edge
R102	1st axis JOG reverse OFF edge
R200	Operation enabled flag for 2nd axis
R201	2nd axis JOG forward OFF edge
R202	2nd axis JOG reverse OFF edge

Number	Description
X100	Ready positioning flag
X104	Tool operation for all axes
X107	Recalculation done flag
X118	1st axis BUSY flag
X119	2nd axis BUSY flag
X160	Error occurrence annunciation for 1st axis
X161	Error occurrence annunciation for 2nd axis
Y107	Request recalculation
Y110	Positioning start for 1st axis
Y118	Home return of 1st axis
Y119	Home return of 2nd axis
Y120	1st axis JOG forward
Y121	1st axis JOG reverse
Y122	2nd axis JOG forward
Y123	2nd axis JOG reverse
Y160	Error clear for 1st axis
Y161	Error clear for 2nd axis

Number	Description
DT0	Starting table number
DT101	Number of errors of 1st axis
DT102 - DT115	Error contents of 1st axis
DT121	Number of errors of 2nd axis
DT122 - DT135	Error contents of 2nd axis
DT10 - DT25	Positioning data (of 1 table) of 1st axis
DT30 - DT45	Positioning data (of 1 table) of 2nd axis

18.2 Sample program

18.2.1 When Settings Done in Standard Area with Programming tool

■ Sample program

Sample program

18.2.2 When Setting Positioning Data in Extended Area by Programming

Write positioning data in the extended area by programming.

Recalculating the positioning data is not necessary as the extended area is used.

Replace the part of the positioning start program in the sample program

■ Positioning start program

Sample program

18.2.3 When Setting Positioning Data in Standard Area by Programming

Write positioning data in the standard area by programming.

Recalculating the positioning data is necessary after setting the positioning data.

Replace the part of the positioning start program in the sample program

■ Positioning start program

Sample program

Record of changes

Manual No.	Date	Record of Changes
WUME-FP7POSP-01	Mar.2013	First Edition
WUME-FP7POSP-02	Jun.2015	<p>Second Edition</p> <p>- Corrected sample programs. (18.2.2, 18.2.3)</p> <p>- Added new functions (Unit version Ver.1.3 or later)</p> <p>Positioning speed change function, Positioning movement amount change function (13.8, 13.9, 17.8)</p> <p>Input time constant change function (5.3.2, 17.6.2)</p> <p>- Change related to FPWINGR7 GUI (5.6, 6.1)</p> <p>- Error correction</p>
